WE beg to call your special attention to our Patent Combined Stay and Fastener, which, from its great advantages and easy mode of use, can well claim a superiority over the common kinds. You will notice that this Fastener has no complex system of working, is easy to fix, and, whether the casement is open or shut, does not project into the room, but hangs down the centre of the sash free from curtain or blind. The advantage of this Patent Fastener is that, being fixed in the centre of the sash, it affords protection against sudden gusts of wind when open, and keeps the sash safely closed when shut, as it acts as a fastener for the casement as well as a stay. Each of the three kinds of Fasteners affords the same advantages in all respects, as, though varying in shape, size, and price, are only different ideas of the same method. These Casement Fasteners can be used both for wood or iron, for single or double casements. The special pattern is used for fanlights to open outwards, and all can be used both for right or left hand. We can supply these Fasteners in any number of links, according to the extent the casement is required to be opened. We may also note that the Fasteners are well made and finished, can be had both in brass and iron, and are, therefore, well suited for any kind of residence. Quotations and further information will be given on application. Also testimonials. Please state in ordering whether you require them for single or for double casements.

Stay and Fastener shown in Action.

Cases for Binding the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

passing through four double cylinders, placed radially in the head of the drum, the sand cleansed from the dust falls to the bottom to pass to the screw for reuse. Two spindles carrying a number of small indiarubber-tired wheels, one to either side of the interval between the tables, the one driving the other by gearing, hold down and traverse the glass. Machines with tables 5 feet wide will obscure sheet glass at the rate of about 300 square feet per hour.

A beautiful translucent variety, known as chip or crystalline glazing glass, covered with grey filaments and fern and feathery markings on an ice-like ground—specimens of which are on the table—is also remarkable for the peculiarities of its manufacture. The surface, first uniformly frosted with the sand blast, is then covered with a coat of strong glue, and when this has set, the sheets are placed in horizontal racks in a room heated to 160 deg. In the course of ten or twelve hours the hardening glue audibly cracks and springs off in patches, bringing away thin flakes of the glass with it. The fern-like markings are irregular portions of the original sand-blasted surface which remain on these flat conchoidal fractures.

This simple process was discovered by an accident, and put to use by Mr. Corsan. Beyond the curious fact that glue under such conditions will tear flakes from glass, the explanation appears to be that the hardening glue gradually blisters, and these blisters as they detach tear off more of the glass by their margins than towards their central portions, which latter leave the fern-like markings. By the employment of the ordinary overlays prior to frosting and gluing, the crystalline effect is sharply localised and confined to any portion of a design.

Lamp-globes and spherical objects are plain or pattern-frosted all over their superficies in an ingenious manner. The drum of the machine—about as high as its diameter—has a hinged cover and moves round on a central vertical pivot. Diametrically within the drum is a spindle, or rather the two ends of a spindle, its central portion removed and replaced by corresponding rods, with spring means of holding, which carry the glass globes. The globe, when in its place, is exactly in the centre of the drum, and the tube of the sand-blast, presented horizontally, points precisely to the centre of the globe. During the frosting the spindle is continuously turned and the drum itself moved round on its pivot through about a half circle, both automatically; the central line of the spreading sand shower—its most active part—thus always points to the axis of the globe, which secures absolute uniformity in the texture of the frosting. Dry sand and air at about 1 lb. pres-

sure are used for ordinary work, and very fine sand with steam at about 20 lbs pressure for the best class of this work. The globes are replaced with expedition and from 60 to 100 may be completed in an hour.

For large works in metal, for the removal of scale from castings and forgings, and obtaining uniform clean surfaces on plates for galvanising, tinning, &c., up to the heaviest, the production of such surfaces on armour plates—the last previously effected by planing and other expensive methods—it is generally necessary to take the sand blast to the work instead of the work to the apparatus. Compressed air is then generally employed, a means of propelling the abrasives which bids fair to supersede all others. The plant on a larger scale, but otherwise the same as that before us, is driven by any convenient power, and consists of an air-compressing pump, a store chamber for the compressed air and the blast apparatus; the last alone needs description.

Mr. Redman, of the Allan and Hill lines, used a compressor giving 60 cubic feet of air per minute, driven by the ship's donkey engine, a 15 cubic feet storage chamber, and builder's sand issuing at 10 lbs pressure from the 7-16 nozzle of a corresponding blast machine, in cleaning the between decks of the iron ss. *Austrian*, 2,882 tons burden, a cattle boat, from many years accumulated coats of hard sea paint, more than an eighth of an inch thick. The example is interesting, because the tough thick paint precisely resembled and resisted the sand blast, just as do the overlays used to neutralise its action on glass and stone; hence the pace was slow, about 12 or 14 square feet per hour. But the paint was entirely removed down to the clean metal, and, as I was assured by the operatives, far better in angles and around bolt heads than they could possibly have done it in their accustomed manner with hammers, chisels and scraping.

The sand blast machine was then replaced by a cognate apparatus, patented by Mr. Redman, containing mixed oil paint; the latter atomised therein and blown as spray by the compressed air through a hose and nozzle, after the same manner as the sand. The exchange of sand for paint is perfectly successful, a uniform coat of flatted paint being laid in the ship on a wall space of 60 feet by 5 feet per hour. A similar arrangement of air compressor, driven by 5 horse power, a chamber for the air, used at 15 to 20 lbs. pressure, a receptacle for the air and paint to mix, nozzle and long hose was used with enormous saving of time and labour in painting the buildings at the World's Columbian Exhibition, Chicago.

E. P. S. STORAGE BATTERIES.

THE
MOST DURABLE,
EASIEST ERECTED
AND

PRICE LIST.

4 Great Winchester St., London, E.C.

The Electrical Power Storage Company takes this opportunity of informing its customers and the public generally that E. P. S. Batteries are manufactured under a number of Patents in its possession, and that no classes of its manufacture in any way infringe the valid Patents of any other Makers, and that on request a guarantee to this effect will be supplied to every buyer of an E. P. S. Battery.

The sand blast used for removing the scale from steel armour-plates at Sir John Brown & Co's Works, Sheffield, has the air chamber of 15 feet capacity, and the compressor, driven by 3 or 4 horse-power, making about 180 revolutions, will charge it at the rate of 60 cubic feet of air per minute. The steel blast pipe of seven-sixteenths bore at the end of the flexible tube, which latter is some 26 feet long, is held at an angle of about 20 deg to and at 3 or 4 inches from the armour plate, and with chilled iron sand issuing at 10 lbs. pressure, the blast thoroughly cleans off the scale at the rate of 1 square foot per minute. The operator protects his face from the dust by a veil of fine wire gauze, or with more comfort by Mr. Mathewson's air helmet, one of which is on the table.

Tilghman's iron sand, just mentioned, is a remarkable abrasive formed of minute spheroidal pellets of hard chilled iron, produced by letting the molten metal fall through fine holes in fireclay, below which cullender, in an atmosphere deprived of all oxygen, the streams are struck and atomised by jets of superheated steam; the resulting red-hot globules drop into water and become chilled to intense hardness. Sifted into sizes, they vary from 80 minute as forty-thousandths up to about one-sixteenth of an inch diameter. This material, of which Messrs. Harrison, of Middlesbrough, have lent samples, is also extensively employed to replace sand and emery in sawing stone and granite.

A difficulty has always existed in the wear of the blast pipe, especially when its rear end is separated from the front end of the steam or air pipe, and the sand is picked up from the space between the two; Mr. Tilghman long ago pointed out to me that, if these two pipes be not precisely in one axial line, the wear at once becomes excessive, necessitating frequent renewals. Wear is now nearly and ingeniously prevented in Mr. Mathewson's round and flat blast pipes, which postpone the mingling of the steam or air with the sand until both have issued from the nozzle.

Sharpening the teeth of files is a notable sand blast process. The teeth of files are formed partly by uniformly distant parallel cuts or indentations, in two series crossing one another, and partly by the burr driven up in making them with sharp, chisel-edged tools and in machines.

Worn-down files are resharpened in the sand blast by being slowly drawn several times from tang to point between two converging streams of fine sand and water—sand worn so fine in grinding plate-glass as to have become valueless for that purpose, and a waste product, is preferred—projected by steam

at about 60 lbs pressure, which passes on from the file into a receptacle for reuse. The effect is rapid, and on both sides of a flat or on all four sides of a square file simultaneously, a 14-inch rough or bastard file being resharpened in from two to three minutes; second cut and smooth files still more quickly produced by the sand-blasting away of the curved until they again meet the upright sides of the teeth, and at but little less angle than before. The file throughout the process is drawn across a piece of gun-metal fixed between the sand blasts, and the equal hang of the teeth to this "feeling piece" tells the operator the resharpening is uniform from end to end.

Worn-out files so resharpened—tried in the writer's workshops—prove nearly as good as new files on iron and steel, but owing to the small loss of angle in the teeth, less so on brass and gun metal, for which the workmen reject them.

Further, and as regards new files, it is found that the teeth do not always prove absolute points, but sometimes curl over, almost imperceptibly, towards the burr sides. A slight exposure to the sand blast at once removes this undesired, hook-shaped burr, leaving the pyramidal points keen. Messrs. Charles Cammel, Turton, Sanderson and other large file manufacturers use the sand blast for this purpose.

Opinions long differed as to its value for new files. I have here a new ordinary 16-inch bastard-cut file, one side of which has been sand blasted and the other not—the means of holding this file at any inclination—and a block of gun-metal. I place the unsharpened face uppermost and the block upon it, and will raise the file until the block slides, which it does at an inclination of about 23 deg. Leaving the file at this angle, I turn it over with its sand-blasted face uppermost and replace the block, which now stands still; and I will again raise the file to the angle, the increased sharpness of the teeth will retain the block, which appears to be 45 deg.

A 16-inch bastard-cut file is sand blast sharpened in 30 seconds; with a little longer exposure the teeth may be made so keen that the file will retain the block until 70 deg; but such excess of keenness sacrifices strength, and the teeth become brittle. In practice the best combination of sharpness and strength appears to be reached when the test-block slips at 42 deg. to 43 deg.

As a practical test I am informed that a definite number of strokes made by a practised hand, with an ordinary new 14-inch bastard file on gun-metal, will remove a certain weight of metal (say 1·19), but that a similar new file that has been sand blasted, used by the same individual, under precisely the

same conditions, will remove nearly twice as much (or 2'19). There is a less marked but appreciable difference on iron and steel, the figures being '988 to 1'2 on cast-iron, '352 to '363 on wrought, and '674 to '758 on steel.

Sixty thousand dozens of new files, of all shapes, cuts and dimensions were sand blast sharpened for the trade at Tilghman's Sheffield Works during the year 1894. The gross trade list value of these files was 63,680*l.*, and the charge for sharpening them was 2½ per cent. on such gross list value. The process being now largely used by many file manufacturers, it is estimated that inclusive of this quantity there were no less than 240,000 dozens of new files sand blast sharpened during the same period in Sheffield alone.

The wet sand and precisely similar apparatus (except that the two blasts strike the file at right angles instead of at about 20 deg. to its surfaces, so as not to wear away the one side of the teeth) is now also very generally used for scouring new files, that is, for cleaning their teeth from the salt and yeast adhering after the process of hardening.

Many now also subject files to a short exposure to the sand blast from time to time during use, thus sharpening them like other tools, to prevent their teeth from ever wearing down to flats. Messrs. Platts, Beyer Peacock, Krupp, the Midland, the London and North-Western and other English and foreign railway companies, the Royal Small Arms Factory, Enfield; the German, Austrian, Japanese and other arsenals and dock-yards, and numerous other large users, include the apparatus in their plant solely for this purpose.

For stone, marble, slate and granite the abrasives are sand, emery and chilled iron sand, delivered at from 10 to 15 lbs. pressure, usually from the compressed-air apparatus already described. The work, which we shall show you presently in operation, is at present confined to intaglio or incision at right angles to the surface, leaving the design on the ground in relief; there are several examples on the table. The overlays are similar to those for glass; if for original designs they are cut out of thick porous paper saturated with the glue and dextrine, by which also they attach to the plain or polished stone; for work often repeated they are frequently iron stencil plates. The quick yet gentle action of the process annuls all risk of "plucking" or splaying the stone, but in some materials and marbles and in granite, which may be considered conglomerates, the harder are rather less cut away than the softer constituents; the sparkling granulation then produced is itself decorative, but if required it may subsequently be smoothed and polished.

The same apparatus is used for cleaning off the sooty weather deposits from stone, granite and brick buildings. Mr. Meikle, at Glasgow, employs a portable engine and the air-compressor mounted on a truck for conveyance from place to place; an air chamber of 15 cubic feet capacity and a small sand blast apparatus, fixed on a railed stage raised or lowered by tackle, as used by painters; the air chamber connected by lengths of 2-inch vulcanised tubing to the compressor on the pavement below. The abrasive, sharp builders' sand, issues from a ½-inch nozzle at from 7 to 10 lbs. pressure. The cleansing is thorough, and, I am told, can be confined to the grime, leaving the plain or carved surface of sandstone similar to that newly worked, and not even roughening the polish on granite. The inclusive cost does not exceed 1*s.* 6*d.* per square yard. There is a slab of sandstone before us showing the dirty incrustation, a portion cleansed by the sand blast, and a third portion subsequently treated with a coat of silicate solution, used by Mr. Meikle to prevent future deposits from again eating into the stone.

THE LONDON BUILDING ACT.

THE subject discussed at one of the conferences during the Building Exhibition was the new London Building Act. Professor Banister Fletcher pointed out that the experience of the working of the Act during the first quarter it was in operation was disappointing. The Act must have cost 10,000*l.* It had not been brought before any higher court than those of the London stipendiary magistrates, but they had had one decision by Sir John Bridge which must carry weight. In the case relating to Messrs. Shoolbred's premises in the Tottenham Court Road, which turned on the point whether extensive additions to premises were of the warehouse or domestic class, Sir John Bridge was reported to have declared that the sub-section dealing with the prescribed angle of 63 deg. and the imaginary horizontal line was "perfectly unintelligible." His condemnation included all other sections, which he said were intelligible in two different ways, and capable of two distinct constructions. Eventually the magistrate decided the case on the question of fact and without reference to the Act. The Professor said he was bound to declare that the Act was not satisfactory to the architectural profession, and the result only showed the difficulty of framing building laws to meet all possible cases. It was the opinion of the late Lord Beacons-

field that if the judges only treated the intentions of the House of Parliament with as much respect as they showed to the interpretations of judges, there would be few difficulties of administration. Some London magistrates took decisions and interpretations under the old building Acts and endeavoured to apply them to the new Act. Nothing could be more fallacious and it would certainly lead to errors. The difficulties of passing such an Act, especially in the way of definitions, were enormous. This was evident from the fact that, as passed, the new Act contained no definition of a "building." The clause as drafted in the House of Commons, but which was struck out in the House of Lords, read, "A 'building' shall mean an erection comprising a cubical space defined by walls, piers, posts, columns, or other supports, and a roof, whether the erection is wholly enclosed or not, and whether it is fixed on permanent foundations or not, and of whatever material the supports, enclosures, or roof may be composed." It was objected that the definition would include three short trestles and a sheet of tarpaulin, and the clause was consequently expunged. In the Act as passed, in section 5, subsection 27, a "public building" included an hotel or lodging-house where the building extended to more than 250,000 cubic feet, and had sleeping accommodation for more than a hundred persons.

Thus, if an hotel had accommodation for a hundred guests the corridors, passages, landings and flights of stairs need only be of wood; but if another person slept there these features must be of fire-resisting materials. It followed, therefore, that according to the strict letter of the law, the district surveyor ought to make domiciliary visits periodically to such buildings to ascertain if a double bed were substituted for a single one, when the whole character of the construction might have to be altered. The section relating to the notice of objection which a district surveyor was to serve on a builder or building owner, relative to alterations required in the plans already submitted, was ambiguous and would without doubt have to be settled by a court of law. Hitherto the architect or builder brought his plans and drawings to the district surveyor, who as a matter of courtesy pointed out any defects or contraventions of the Act, and they were amended. Under the new Act the district surveyor had to give a notice of objection based on the builder's notice and not on the plans and drawings. From this it would seem that the builder must be allowed to go on with the works, and the district surveyor's opportunity for objection to irregularities arose when they were executed. The district surveyor kept no drawings, he would therefore not be able to

prove his points. District surveyors would be likely to follow the old practice, but sooner or later difficulties would arise. Among the omissions in the Act might be mentioned one relating to pugging of floors in habitable rooms constructed over stables. It was provided that a 3-inch layer of concrete should be placed between the floor and ceiling between joists, but there was nothing providing that the materials should be fire-resisting, or should serve any other purpose than to prevent effluvium ascending into the rooms from the stables. Nothing was said as to whether the joists were of wood or iron, nor was the point made more clear by the schedule. Then, again, as to the heights of future buildings next the street. Where a street was laid out before August 1862, if the street were 50 feet in width, a new building might be six storeys in height, in addition to two storeys in the roof; and if the street were less than 50 feet wide, the height might only be equal to the width of street. The question consequently arose, was the diagonal line regulating the height by the street's width to apply to the rebuilding of old premises? He thought it did not, and could not be made to apply to the reconstruction of old buildings, but that they might be re-erected to the same height as the old buildings which were replaced. Again, let them take the case of old lofty buildings in an old street where a wider thoroughfare was desired; could the owner in such a case re-erect his buildings to the old height? The Professor thought he could not do so if the prescribed open space at the rear would be impinged upon. Further, it was enacted that most buildings exceeding 30 feet in height and having a parapet must be provided with dormer window or some proper means of access to the roof. If there were no parapet, as in the common case of a detached house with gable ends, must access still be provided to the roof? Under section 43, before commencing to erect new domestic dwellings on an old site, plans had to be prepared showing the extent of the previously existing domestic building in its several parts, which had to be submitted to the district surveyor that he might certify as to their accuracy. The owner might then proceed to erect the intended domestic building, but he must so build that no more land should be occupied by the newly-erected building than was occupied by the one previously existing, as so certified. If the building owner were to deviate from the old plan, he had to apply to the Council, and if dissatisfied with their decision, to the Tribunal of Appeal. Supposing the frontage of the new building were set back, might the open space previously existing at the back be reduced in area to the extent of the land in front left open that

was previously built over? The section was not clear upon this point, and likewise as to where the diagonal line was to be drawn from in cases covered by the section. The latest point raised was whether party-walls above a certain height ceased to be party-walls. The County Council fought the case, and it was decided against them, but the decision of the High Court was based on the legal interpretation of the Act of forty years ago. The appeal and judgment might, therefore, be regarded as an utter waste of time. With regard to the taking down of a building, a very curious point relating to a party-wall had been decided in the Thames Police Court. A fire occurred in some warehouses in Church Street, Minories, and one of the buildings, of which only a third had been injured, had been rebuilt. The adjoining warehouse, of which the greater part was destroyed, was left unrepaired, and the building owner of the first warehouse gave notice of an intention to reinstate the wall. As the party-wall had not been destroyed to an extent of one-half its area, it was admitted that it could not be dealt with under section 208; but the district surveyor and County Council sought to treat the party-wall as a portion of the warehouse which had been nearly destroyed. The magistrate held that, since it was not sought to rebuild the latter warehouse, and the party-wall had not been taken down to the extent of one-half, the wall could be reinstated without regard to the more stringent requirements of the new Act. A fortnight after the decision was given, the building owner of the burnt-out warehouse gave notice of his intention to rebuild, but declined to deal with the party-wall under the new Act. The magistrate again decided against the district surveyor on the ground that section 208 ousted the provisions of section 5, subsection 6. It would be seen, therefore, that the difficulties of district surveyors under the Act were very great, for within the last three months there had been four decisions against the enforcement of the Act because it was not so framed as to be clearly understood of the people.

Mr. Frederick Waller, district surveyor, said he could not agree with Mr. Banister Fletcher as to the hardship of making objection to the builders' notice and to the drawings. He had on one occasion to fight a case against an architect until it reached the House of Lords, and when the case was decided against the architect the point was raised that objection should have been taken earlier. As regards the Tottenham Court Road case, he did not disapprove of the decision, as to have upheld what he deemed to be the letter of the law would have been a peculiar hardship to

Messrs. Shoolbred, who had practically conceded what was required. They had reduced the sleeping accommodation, and had undertaken to provide fireproof floors and better staircases. As the proposed premises contained a few offices and rooms to be used for writing, Sir John Bridge decided that the building was of the warehouse and not of the domestic class. His own opinion was that unwarranted importance was given to the decisions of the magistrates in building cases. If a building owner wished to evade the Building Act he had only to instruct one or two counsel to so begot the magistrate with references to numerous clauses as to compel him to take refuge in what he termed a "common-sense aspect of the matter," and a decision so arrived at was quoted by the professional papers as of great importance. He maintained that the diagonal line of $63\frac{1}{2}$ deg. was neither easily explicable to a layman nor was it mathematically accurate. A better rule would have been to have prohibited the raising of any building higher than twice the depth of the open space at back. Another difficult point was the question of concrete walls. From the first schedule it seemed they must be one-third thicker than walls of brick. There seemed no power to prevent the use of a building for purposes other than those originally declared, and he feared there would be a good deal of evasion of the Act carried out under the guise of conversion. The Act would, without doubt, have to be amended and simplified.

Mr. H. Phillips Fletcher considered that the rule as to setting back walls under section 41 would lead to much imperfect construction, to increased cost, sacrifice of area of rooms, and more danger from fire. The determination of the County Council not to allow district surveyors hereafter appointed to practise as architects had been to reduce the number of candidates very largely, and would lead to the appointment of an inferior class of officials.

Mr. Solomon, in summing up the discussion, said the wonderful Act they had been discussing contained three bad features—inequality, vagueness and incompleteness. Under it a shop having a superficial area of 1,000 cubic feet—that is, one of 50 feet depth by 20 feet frontage—had to be provided with fire-resisting floors and other costly requirements. Many of the clauses would be found to be contrary to the intention of the framers. Lately he remonstrated with a district surveyor who refused to consider plans unless inked in; but, on reconsideration, he wrote to the surveyor, acknowledging that his rule not to pass drawings in pencil was a wise safeguard against

the tricks of jerry builders. The County Council had prudently reserved to themselves great discretionary powers, and it was clear that district surveyors had wide scope for option as to insistence on the words of the Act. Under schedule 2 no thicknesses were provided for concrete walls, and it was a question whether a wall might not be raised between wire network only $1\frac{1}{2}$ inches thick without infringing the Act. There was considerable friction between the working by the County Council of the Building Act and by the vestries of the Public Health Act of 1891, and he suggested that the Institutes of Architects and Builders should endeavour to obtain a power to appeal under the Public Health Act to some tribunal.

Professor Banister Fletcher, in reply, said it was quite clear that under the Act objection should be raised on the notice and not on the drawings. The thicknesses of walls constructed of concrete was provided for in the first schedule, part ii. sub-section 13, which stated that "the thickness of any wall, if built of materials other than those specified, should be deemed to be sufficient if made of the thickness required for brickwork." The change of user of a building might hereafter give trouble to district surveyors, and required close attention. The experiences of the new Tribunal of Appeal would not be an unmixed evil, for men would hesitate before going before it. The district surveyors had no interest in worrying the public; they simply had to administer the Act fairly. It had been said that the fees had gone up in the districts where the surveyors were appointed under the new rule prohibiting private practice, the reason being that those surveyors had a greater interest in getting the full fees out of their district.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

THE members of this Society, on Saturday, April 6, visited the works of the Great Wheel that is now in course of construction at West Kensington. The wheel is 270 feet in diameter, and the top car will be 300 feet from the ground. The axle is made up of inch plates, is 7 feet 6 inches in diameter, and weighs 53 tons. It will run in cast-iron bearings lined with white metal. The towers which carry the bearings of the wheel are of steel, and consist of eight columns, 4 feet square and 180 feet high, and weigh 700 tons, the weight of the wheel being 800 tons. The speed it is proposed to drive the wheel is one revolution in twenty-five minutes, stopping five times for

passengers. The cars attached to the wheel will be forty in number, 20 feet in length by 9 feet by 9 feet, and to judge from the sample shown will be exceedingly comfortable places to spend twenty-five minutes in. The cars will be suspended from the periphery of the wheel. The points of suspension of these are situated near the top, so that the floors of the cars will be always in a horizontal position. The wheel is constructed on the principle of the modern bicycle wheel, namely, with spokes in tension, and not in compression. The whole of the main structure is of steel. The wheel will be turned by means of an endless chain driven by two horizontal engines, which are coupled up with the mechanism, as required, by two of Lindsay's spring clutches. The engines and boilers are in place and ready for work. The wheel was designed by Mr. W. B. Basset, and the resident engineer is Mr. C. F. Hitchins, who kindly showed the party over the works. The members then visited the site of the forthcoming Indian Exhibition, by permission of Mr. Collard, the architect, and were shown the French Hippodrome (a work of considerable size), a large roof in course of construction by Mr. Handyside, and a newly-built mosque for the use of the Mohammedan attendants who will be at the exhibition. A vote of thanks to Mr. Hitchins, proposed by the president, Mr. C. T. Walrond, and seconded by Mr. E. H. G. Brewster, hon. secretary, closed a most interesting visit.

PORTLAND CEMENT: SOME POINTS IN ITS TESTING, USES AND ABUSES.*

PORTLAND cement, in the generally accepted sense of the term, consists of a mechanical mixture of chalk and clay (or other materials containing the requisite chemical constituents), calcined to incipient vitrification, the resulting clinker being reduced to a more or less impalpable powder. The chief chemical components of a good Portland cement may be said to range as follows:—

		Average.
Silica	20 to 28 per cent.	24 per cent.
Oxide of iron and alumina	8 to 14 "	11 "
Lime	58 to 65 "	61.5 "

VOLUME LII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

These generally constitute about 96 per cent. of the whole, the remainder being made up of small proportions of magnesia, sulphuric acid, alkalies, &c.

Portland cement can be manufactured from any raw materials containing the requisite chemical components, but of course its economical production depends entirely upon the ease with which these raw materials lend themselves to a thorough mechanical admixture before being converted into a chemical compound by the agency of heat. There are natural formations containing the constituents of uncalined Portland cement, such as are found in Cambridgeshire and elsewhere, but generally speaking these formations are not altogether to be depended on for uniformity, and the most reliable results are obtained from those materials which require mixing in certain proportions, so as to contain the requisite amount of the proper chemical ingredients. The materials most generally used in this country, and those which are most economically treated, are the chalks and clays found in the neighbourhood of the lower reaches of the Thames and Medway, and although the industry is extensively carried on in other parts of the country, it may be taken for granted that the greater part of the cement manufactured in England is made from the materials in the district referred to.

The properties appertaining to cement, which it is necessary to ascertain in order to arrive at an opinion of the constructive value of a given sample, are the following:—

1. Soundness, viz. freedom from destructive agencies within itself, or, as it is generally termed, "blowing."
2. Fineness of grinding.
3. Strength, cohesive and adhesive.
4. Time of set.

The soundness of a cement is a most important point, as it is evident that no matter to what fineness it may be ground, or what strength it may develop at the earlier dates, if it eventually expands and disintegrates it is not only of no value as a constructive material, but it is at once converted into a destructive agent. On this point the author would like to quote the opinion of his late principal and colleague, Mr. Henry Faija, an opinion which he fully endorses, viz. that if a cement is sound, it is almost invariably strong enough for any work in which it may be used. The soundness of a cement generally used to be considered as satisfactory if a pat, gauged with the minimum of water, and placed on a glass or other non-porous slab, showed no cracking or lifting at the edges at the expiration of seven days, either when plunged imme-

diately into water, placed in water as soon as set, or left in the air. The author's experience is that this test is not altogether reliable, as he has known instances in which pats, treated as above, are perfectly sound and good at the expiration of seven days, and the briquettes also show a good tensile strength, but when kept for a period of twenty-eight days both pats and briquettes have been found to show signs of disintegration. He has also known cements give perfectly satisfactory results at the expiration of twenty-eight days, and even then deteriorate at the end of a longer period. The most reliable test for the soundness of cements, in the author's opinion, is that which was introduced a few years ago by Mr. Faija, of which a full description is given in the paper read before the Society in 1885. It essentially consists in subjecting a freshly-gauged pat to a moist heat of 100 deg. Fahr. until set, and afterwards placing it in warm water of 115 deg. Fahr. for the remainder of the twenty-four hours. The author has had a large experience of the apparatus for carrying out this test during the past ten years, and if a pat treated therein shows no signs of "blowing," the cement may be used with perfect confidence. If, on the contrary, it shows cracks or other signs of unsoundness, it is a danger signal, and the utmost caution should be used before sanctioning its use in any constructive work. Of course the indications of unsoundness may be due to the extreme freshness of the sample, in which case it is advisable to lay it out to cool for a few days before finally deciding as to its use. If at the end of that period its objectionable characteristics have disappeared, it may be assumed that it would become fit for use with a little aeration; but if, on the other hand, it still "blows," it should not be used on any account, or, at all events, not until sufficiently aerated to show no signs of expansion when treated as described.

The hot test of Deval, in which the cement is immersed in water at 176 deg. Fahr., seems to the author to err on the side of severity, as there are very few cements manufactured at present which will bear being subjected to that test, unless, indeed, they have previously attained considerable age. Although it may be considered perfectly safe to use any cement that passes this ordeal satisfactorily, it is a little hard on the manufacturer to reject a sample that will not pass the test; for it is very certain that many cements which have been used, and have given perfectly satisfactory results in practice, would have been rejected if the Deval test had been insisted upon.

The fineness of grinding of a sample largely determines its

usefulness as a constructive material, as it is well known that the finer a cement is ground the better will be the results obtained from it when mixed with sand or aggregate. There is a growing demand for finer cement, and doubtless this is a tendency in the right direction, but in specifying finer cement the user must not lose sight of the fact that finer cement means extra wear and tear on grinding machinery and reduced output, and therefore if an extra fine cement is required he must expect to pay a somewhat higher price. At the same time, with other methods of grinding, there is no doubt that many manufacturers are able to keep pace with increasing demands for smaller residues. Looking back at some old testing books fifteen years ago, 20 per cent. on a 50 sieve was not an uncommon residue to find recorded; eight years ago it had been reduced to 10 per cent., and now many manufacturers ordinarily grind down to 5 per cent.

Various kinds of edge-runner mills in lieu of mill-stones have lately come into considerable use for grinding cement, and no doubt some of them perform their work economically. Apart from the economy, however, the fact remains that cement thus ground rarely contains the same proportion of impalpable powder as that ground by stones. As it is this impalpable powder which is the essential feature of the cement, this is an important matter. It is very easy to imagine a cement thus ground which may all pass through a sieve of the meshes ordinarily used in testing, and yet may contain scarcely any flour. A cement ground by mill-stones in the ordinary way, and leaving 10 per cent. on a 50 by 50 sieve, is generally equal in cementitious properties to one ground by edge-runner mills, leaving about half that residue. It therefore seems to suggest that, instead of specifying not more than a certain amount of coarse residue, the amount of impalpable powder, or "flour," to be determined by elutriation or other means, should be specified.

A matter which is often overlooked in testing a cement in this particular is the thickness of the wire of which the gauze is composed. It is obvious that if the wire of a sieve having the specified number of holes to the square inch is abnormally thick, the size of the hole will thereby be reduced and *vice versa*, and in some instances may cause the rejection of a cement which would otherwise pass the specification.

The strength of a cement is generally ascertained by means of its resistance to a tensile strain, as being the easiest and most convenient test to carry out. It is doubtful, however, if in practical use cement is ever subjected to this strain, and it

is therefore only a comparative test. The most desirable feature to be observed in testing a cement for tensile strength and one to which too much attention cannot be given, is the increase in strength of a given sample between the different dates of testing. It is obvious that a sample which develops a moderate strength at the earlier date and continues to increase steadily at each subsequent date, is preferable to one which attains 90 per cent. of its strength at the seven days and its full strength at twenty-eight days, while at the longer periods it shows a tendency to decrease. In the present methods of testing, the results obtained depend very much upon the skill of the operator, and therefore a considerable allowance should be made if the testing is to be carried out by inexperienced persons.

The author well remembers one occasion a few years back when a dispute arose as to the quality of a consignment. He visited the works in company with representatives of the manufacturer and contractor, and samples were duly drawn from the bulk and taken to the works office, to be tested in the presence of the officer in charge. The operator in this instance was an ordinary bricklayer, whose chief idea seemed to be that the water should contain a certain percentage of cement in contradistinction to the generally recognised practice, that the cement should be mixed with a certain percentage of water. With the aid therefore of a whitewash brush and a large trowel, the cement was reduced to the consistency of a thin cream and poured into the moulds. Needless to say there was not much difficulty in understanding the reason of its not having passed the specification, especially as in this instance the sample was very slow setting.

The correct amount of water to be used in gauging cement varies greatly, and no hard and fast rule can be laid down on this point, each cement requiring a quantity peculiar to itself, depending largely on its fineness and setting properties. In the author's testing-room the correct amount of water is considered to be added when by ramming and shaking the cement into the moulds the moisture just comes to the surface of the briquette. If more water than this is added an inferior result is obtained, while if a less quantity is used, crystallisation has been set up without any possibility of its being completed, on account of insufficient water, and therefore in this respect also an inferior result is obtained. Objections have sometimes been made with respect to beating and ramming the cement into the moulds for the purposes of testing, but the author's contention is that the object of a laboratory test is always to

obtain the best results from the cement under examination, and that being so all reasonable methods are allowable for obtaining this object. The disposition to specify excessive tensile strains at seven days is not so prevalent as it was a short time back, and this is perhaps a point for congratulation. Experience shows that high strains generally require high percentages of lime, and to get the high strains sometimes asked for it is absolutely necessary to "lime" up to the verge of "blow." In such cases extreme care is necessary in the manufacture, and only those acquainted with practical cement making can appreciate the very small margin of lime allowable between a sound cement of high tensile strain and an unsound one, the latter bringing all sorts of unpleasantness in its train.

The time of set of a cement is only of importance where it is either abnormally quick or abnormally slow, except of course in special cases such as tidal work, where it is desirable that cement placed in position at low water should be sufficiently set to prevent the rising tide separating it from the aggregate. The most important point in the set of a cement is what is generally known as its initial set, i.e. when hardening or crystallisation commences, as when this point is reached the cement should be in its allotted position, and allowed to remain without being disturbed, otherwise the crystallisation will be arrested and the ultimate strength of the material weakened. The time of initial set should not give any trouble in practice, as it is a very simple matter for the clerk of works or the foreman in charge to make a small pat and, noting the time when hardening commences, take precautions accordingly.

Temperature and climatic influences play a very important part in the setting of cement. The author's attention was particularly drawn to this matter a very short time ago. A shipment of cement which had been tested in the ordinary course before leaving England satisfactorily passed the requirements of the specification as to set, but on reaching its destination in a hot climate the engineer in charge complained that it set too quickly. This induced the author to institute a series of experiments to ascertain the comparative time of set at different temperatures, the results of which are given in Table I. In each series of experiments an exactly similar amount of water was used for gauging, the water being of the same temperature as the chamber in which the pats were placed, and to insure a moist atmosphere the bottom of the vessel was lined with a damp cloth. The cements were not in any way chosen specially for this experiment, but have been arranged in the table according to their time of initial set. The difference in setting is

distinctly marked at each temperature, more especially between 40 deg. and the normal 60 deg.

* Contain a considerable admixture of Kentish rag.

A test that is sometimes asked for, and which perhaps represents the more usual strain to which cement is subjected, is its resistance to crushing. Generally speaking, the crushing strain of a cement is from six to nine times its resistance to a tensile strain. It is, however, rather an inconvenient method of testing; and as a comparative test the results are but little superior to the tensile strain. Added to this the opportunities of error are much larger, as, if the surface of a cube at the point of contact is not perfectly true, the pressure comes on to the highest portion first, and thus crushes it in detail.

Provided the foregoing points are satisfactory, the colour of a sample does not matter so much, except of course for work that is exposed to view, when it should be of a cold blue-grey. This blue-grey colour may generally be taken as an indication of sufficient calcination, while if the sample has a yellowish tinge, it indicates the presence of underburnt cement, either on account of the general calcination having been insufficient, or else that the picking of the clinker to eliminate the unburnt

PROVINCIAL NEWSPAPERS.

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

portions has been carelessly carried out. If this yellow colour exists to any great extent, the presence of uncombined lime would probably cause it to give indications of expansion when treated in the Faija apparatus already mentioned.

The weight per bushel of a sample is now not often specified, as it is not much of a guide to the user as to the quality of the cement. To the manufacturer it may perhaps be of use, as it is an indication to him of the amount of calcination to which his cement has been subjected. If the density of a sample is required it is better to determine it by means of its specific gravity, which is not affected by the fineness to which a sample is ground.

The chemical analysis of a Portland cement is often of great corroborative value in estimating the properties of a sample, but the treatment which the raw materials have undergone during the process of manufacture so largely affects the resulting cement that an analysis should never be relied on by itself. Its chief use is in detecting the presence of an excess of any deleterious constituent, as well as in determining the amount of useful components, and this knowledge, in conjunction with the mechanical tests, enables an accurate opinion to be formed as to the future behaviour of the sample. Generally speaking, however, chemical analysis is of more value to the manufacturer than the user, as knowing the exact treatment to which the raw materials have been subjected, he is able to judge with accuracy what characteristics they should develop in mechanical testing and to regulate his mixtures accordingly. The importance of analysis is now generally recognised by manufacturers, and most firms, if they do not employ a resident chemist, at all events recognise the importance of having periodical analyses both of their raw materials and finished cement.

The uses of Portland cement are so numerous that, in a paper of this description, it is only possible to glance at them in passing. Perhaps the most valuable property is its power of setting and hardening under water, which combined with its great strength, renders it peculiarly adaptable to pier and harbour work, where it often proves an indispensable material to the modern engineer. The theory that sea-water affects cement prejudicially caused considerable excitement a few years ago when the failure occurred at Aberdeen, but subsequent experiments proved that with sound cement, properly manipulated, the engineer has nothing to fear from the effects of sea-water. That sea-water does attack unset Portland cement to a certain extent, the author has since proved by direct experiment. His experiments, however, seem to point

to the conclusion that it is only attacked on the surface, where it is directly exposed to the action of the sea-water, and unless a concrete is extremely porous and thus allows the sea-water to percolate freely through it, it should not have any detrimental effect. Moreover, the attacked portion in a neat cement does not extend above a quarter of an inch from the surface, the interior being totally unaffected, and although it continues for some time soft and unset, it eventually acquires a certain hardness, and forms a protective skin against further attack. It would therefore seem that slow-setting cements are not so suitable for sea-water work as the quicker setting varieties, the former giving more opportunity for the attack of the sea-water.

(To be concluded.)

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 6134. William Sykes, for "Improvements in yard gullies."
- 6135. William Sykes, for "Improvements in disconnecting slippers for waste-pipes from baths and sinks, &c."
- 6136. William Sykes, for "Improvements in street-gullies."
- 6200. Benjamin Greenwood Smith, for "Improvements in traps and unions for lavatories."
- 6201. Stuart Cunningham Kelly, for "Improvements in appliances for holding cords of window-blind rollers."
- 6229. William Ford Stanley, for "Improvements in surveyors' levels."
- 6255. John Leeming, for "An improvement in pipes or channels for drains and sewers and in the jointing of same."
- 6343. Samuel Whitehead, for "A new or improved sash-fastener."
- 6461. Julius Graef, for "Lattice for windows."
- 6488. Peter Mackenzie, for "Frames and casings for window-sashes and blinds."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing.

THE MARTYRDOM OF ST. STEPHEN. By E. J. POYNTER, R.A. Size, Forty Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

"AND THE SEA GAVE UP THE DEAD." By Sir FREDERIC LEIGHTON, President of the Royal Academy. A few Proof of this Fine Art Plate can be obtained (if ordered at once), price Two Shillings each. Free by post, carefully packed inside patent roller Two Shillings and Two Pence.

THE BANQUET. The well-known and beautiful Chromo-Lithograph by H. STACY MARKS, R.A. Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

1. AN OFFERING TO CERES. 2. THE EDUCATION OF BACCHUS. 3. MINERVA VISITING THE MUSES. 4. JUDGMENT OF MIDAS. By W. HAMILTON. Size of each plate, Forty Inches by Fifteen Inches. The whole forming a very beautiful Frieze in Bartolozzi Mezzotint. Price per set, Six Shillings on Proof Plate. Free by post, carefully packed inside patent roller, Six Shillings and Six Pence.

THE HISTORY OF JOAN OF ARC. By M. JULES EUGENE LENEVEU. From the Wall Painting in the Panthéon, Paris. Four Pictures on one Plate. 1. Domremi: Inspiration. 2. Orleans: Struggle. 3. Reims: Triumph. 4. Rouen: Martyrdom. Size, Forty Inches by Fifteen Inches, on Proof Plate. Price, Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Six Pence.

THE WATERLOO HEROES. By J. P. KNIGHT, R.A. Dedicated, by Special Permission, to VISCOUNT WOLSELEY, K.P., G.C.B. Proofs, price One Shilling each (thin Plate Paper). Proofs (Special), price Two Shillings and Six Pence each (thick Plate Paper). Size Twenty Inches by Thirty-six Inches. Framed and Glazed in Oak, Complete, One Inch, Twelve Shillings each. Ditto, One and a Quarter Inch, Fourteen Shillings each. Ditto, One and a Half Inch, Seventeen Shillings each.

THE TOILERS OF THE DEEP. Two Tinted Ink Photographs. Size, Eighteen and a Half Inches by Thirteen and a Half Inches. Price Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Three Pence.

JOHN SELL COTMAN'S PICTURES, lately on Exhibition at the Burlington Fine Arts Club. The Plates are uniform in size, Twenty-one Inches by Fifteen Inches. The Titles are as follows:—1. Rouen from Mount St. Catherine. 2. Breaking the Clod. 3. View in North Wales. 4. Norman Arches. 5. Byland Abbey. 6. Norwich, from the Cromer Road. 7. Dewy Eve. 8. Mousehold Heath. 9. Cader Idris. 10. Castle Eden Dean, Durham. 11. Bamborough Castle. 12. The Interior of Norwich Cathedral. 13. Mountain Pass in the Tyrol. 14. Postwick Grove.

The price of the Set is Twelve Shillings and Six Pence; by post, carefully packed in patent roller, Thirteen Shillings. Kindly order early, as only a limited number of proof copies can be obtained.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publisher, P. A. GILBERT WOOD, 175 Strand, London, W.C.

THE
Architect and Contract Reporter.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

WINTON.—April 22.—For Building Schools. Messrs. Lawson & Donkin, Architects, Yelverton Chambers, Bournemouth.

THAMES NAVIGATION.

THE river Thames has for ages been the source of pleasure for Londoners, as also for visitors to London, when occasion offers them the opportunity of a trip to the great metropolis. Mr. Edgar Shand, so long connected with the steamboats on the Thames, it will interest many to hear, is about to place on the river a new light-draught passenger steamer, to be completed early in June. This steamboat will be 165 feet long, 15 feet 6 inches beam, with a draught of water of only 15 inches, and she will carry about 730 passengers. She will be fitted up very luxuriously, having an awning, with curtains, to be used as required, to protect passengers from bad weather. The deck will be carpeted, and is to have velvet pile cushions all round. The saloons will also be carpeted and upholstered in velvet.

NATIONAL TELEPHONE No. 6.

Telegrams, "IRON, WELLINGBORO."

VARIETIES.

IN regard of the proposed drainage scheme, the Linlithgow Police Commissioners have resolved to submit the question to Professor Armstrong. In consequence of the refusal of the Duke of Hamilton to lease ground for the proposed works in the neighbourhood, they seek an opinion whether the new scheme of works will create a nuisance.

At the meeting of the Caithness County Council accounts were submitted showing that 828*l.* 13*s.* was spent on cutting the snow on the county roads during the past winter, and that the Highland Railway Company paid 2,027*l.* for snow cutting.

The successful candidate for the post of highway surveyor for the Selby Rural District is Mr. John Walker.

WE regret to record the death of Mr. Arthur Loader, of Brighton, who was much esteemed both in public and private life.

THE *Scotsman* says:—A new industry is about to be started near Johnstone. Mr. D. R. Adam, Kirkhill Collieries, Cambuslang, is erecting machinery at No. 3 Douglas Pit, Inkeremann, for the conversion of the huge bings of blaze into bricks. The works are to be extensive.

THE subsidences in the Ladywell district of Motherwell caused by the coal working in the neighbourhood are still extending, and a building which for some time has been partially damaged is now in imminent danger of collapsing altogether. The tenants of several of the houses have had to remove, part of the property being condemned as unsafe.

KILSCONNEL CHURCH, county Wicklow, has been destroyed by fire, the outbreak having been caused by the overheating of a flue, which took place while service was being held. The congregation safely dispersed without panic arising.

At the meeting of the Glasgow Association of Students of the Institution of Civil Engineers, Mr. D. Drummond, M.Inst.C.E., president, in the chair, Mr. Robert F. Miller gave a short description of the setting out of the Black Rig tunnel on the new Loch Katrine aqueduct. This tunnel is 2½ miles long, driven from both ends and also from two shafts placed a mile and a half apart. Until the tunnel is driven between each shaft and the open end nearest it, the line has to be set off from a basis of about 6 feet long, obtained by plumbing down the shafts, which are 160 and 110 feet deep. The following office-bearers were elected for session 1895-96:—President, Wm. Crouch; vice-presidents, John Cowan, jun., J. E.

Harrison and Thos. Nisbet; honorary secretary, W. B. Vinters; student members of council, W. C. Easton, W. M'L. Homan, Angus M. Stewart and Thomas H. Watt.

At the meeting of the Johnstone Town Council there was a prolonged discussion on an application by Messrs. Kerr & Watson for gas supply for several buildings they are erecting at Thorn. Bailie Green contended that it was illegal to put down pipes at the ratepayers' expense till the street was taken over. The matter was remitted to a committee.

WE hear that Mr. George Wragge, of the Wardry Art Metal Works, Chapel Street, Salford, has appointed Mr. Pridmore (for many years with Messrs. Richardson, Ellson & Co.) as his representative in London, and that he will act solely on his behalf. Mr. Pridmore has models and sections of the various wrought-iron and steel sashes and casements and also specimens and photographs of artistic metalwork at Mr. Wragge's showrooms, 22 Surrey Street, Strand, W.C.

THE accounts of the London and Lancashire Fire Insurance Company for the past year have just been issued to the shareholders. They show a net premium income of 846,213*l.* 12*s.*, a surplus on the year's underwriting account of 65,256*l.* 17*s.* 8*d.*, and interest on investments, &c., of 29,722*l.* 18*s.*, the two latter items representing a total profit on the year's operations of 94,979*l.* 15*s.* 8*d.* The directors propose to pay the same dividend as for last year, viz. (including the interim) 10*s.* per share, or 20 per cent. on the paid-up capital. The financial position of the company will then stand as follows:—Capital paid up, 212,750*l.*; reserve funds, exclusive of capital, 700,201*l.*; reserve capital at call of directors, 1,914,750*l.*

MR. J. E. KNOX, of Kennington, who is known for his restoration of wood-carvings in ancient churches and old English mansions, associated with Mr. Stephen Webb, the recently-appointed teacher of design at South Kensington, is showing at the spring exhibition in the Walker Art Gallery, at Liverpool, a duplex-fronted upright piano-case, most unique in its details. The lop-sided piano is completely superseded. Back and front are alike, and the outer case is finished in satinwood, with marquetry engraving on rosewood ground. There is no back keyboard, but beneath the back fall is a repertory for sheet music finished in satinwood.

THE new and revised edition of "Cassell's Illustrated History of England" just completed has occupied nearly nine years to produce. The new illustrations prepared expressly for this edition have cost upwards of 11,000*l.*

TRADE NOTES.

TENDERS are invited from sculptors and others for the erection of a public fountain, Pontypridd, the gift of Mr. A. Thomas, M.P. Specifications, with full particulars, may be obtained from the architect, Mr. C. B. Fowler, Old Bank Chambers, 27 High Street, Cardiff. Tenders not later than April 30.

THE Annan Academy, Annan, is being warmed and ventilated by means of Shorland's patent Manchester grates and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE learn that Mr. Douglass Francis, who, for over fifteen years, was connected with Messrs. Goodwin, Barsley & Co., has started business on his own account at Loughborough Road, Leicester. The new works and showrooms of Messrs. Francis & Whittington, ironfounders and hot-water engineers, are in Mansfield Street, Leicester, and are now on the eve of completion, and in a few days the latter will be furnished with a large and well-selected stock of marble and wood chimney-pieces, tiled registers and kitchen ranges, builders' ironwork, &c. The central situation of the works will contribute to ease in executing and despatching orders.

WE are pleased to inform our readers that the Britannia Company, of Colchester and London, are now opening an electrical department at their London office, 100 Houndsditch, for all kinds of high-class electric work, more especially for electric lighting and transmission of power. This company is well known in connection with their Britannia oil-engines, which require no electricity, steam, boiler, driver, nor water, except for the water jacket.

THE "Journal of Useful Information" of Messrs. Romeike & Curtice, of the Strand and High Holborn, is unique in respect that it is entirely typewritten.

A THREE-LIGHT richly stained and painted memorial window was placed last week in the north transept of the parish church, Harrow-on-the-Hill, the subjects represented being "David," "St. Luke," and "Miriam." The window was designed and executed by Messrs. W. B. Simpson & Sons, 99 St. Martin's Lane, W.C.

ELECTRICAL.

THE Board of Trade have decided to grant the provisional order applied for by the Leigh Urban District Council for power to supply electricity within the area of their jurisdiction. The Board have also granted the order sought by the Radcliffe Urban District Council for power to supply electricity within the urban sanitary district of Radcliffe.

At the Ayr Town Council meeting Mr. Hammond, electrical engineer, reported that the new works in Mill Street were progressing satisfactorily. A high-tension main had been laid in Mill Street, a low-tension main from Mill Street to the top of High Street on the east side, and a high and low tension main on part of the west side of High Street. It was suggested that the light should be taken into the Town Hall and into all the properties belonging to the burgh.

THE citizens of Edinburgh have had the satisfaction of seeing the electric light turned on for street illumination. Elsewhere we refer at more length to the subject.

At the St. Pancras Vestry's meeting, Mr. Churchwarden J. Thornley, J.P., presiding, the electricity and public lighting committee presented a statement of accounts for the year ending December 31 last, and drew attention to the very satisfactory result of the past year's working. The generation expenses in 1893 amounted to 6,103*l.* 4*s.* 1*d.*, and in 1894 to only 73*l.* 5*s.* 1*d.* in excess of this amount, while the increase in the current sold to private consumers reached 2,510*l.* 12*s.* After paying all charges for repairs and maintenance, including rates and taxes, there was an available balance of 7,233*l.* 1*s.* 4*d.* to meet the interest and payments of the instalments off loans, namely, 5,379*l.* 19*s.* 2*d.*, comprising interest on the bank overdraft. Hence there was a net profit on the year's working, after providing for bad debts, &c., of 1,753*l.* 18*s.* 2*d.* This sum, with the amounts paid for interest and repayment of loans, was equivalent to a dividend of over 6 per cent. on the capital expenditure, and would be available

CARVED OAK AND ANTIQUE DEPARTMENT, No. 204 TOTTENHAM COURT ROAD.

Extract from THE GENTLEWOMAN (Mrs. PANTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own power, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

Replica of an OLD ENGLISH Carved Oak Hall Press, 16th century, 5 feet wide, 7 feet 6 inches high.

for distribution to the shareholders if the undertaking belonged to a company. The committee considered that the sums paid off loans by St. Pancras in 1894 was equal to nearly 2 per cent. on the capital expenditure, and was equal to the sum set aside for depreciation by three London companies who were working on similar systems to that in St. Pancras, while if the comparison was made with the total capital expenditure of the whole of the London companies, it would be found that the amount set aside by them for depreciation was under 1 per cent. The charge for public lighting during the year, although more lamps had been erected, was reduced by 515*l.* 16*s.* 11*d.* in one quarter owing to the charge being reduced from 6*d.* to 5*d.* per unit. Current sold to private consumers at 3*d.* per unit realised 1,236*l.* 13*s.* 9*d.*, and at 6*d.* 10,819*l.* 15*s.* 9*d.*

THE Bath Town Council propose to apply for a provisional order for electric lighting purposes.

THE electric light has just been inaugurated at the Brill's Baths, Brighton.

BUILDING AND BUILDERS.

THE War Department's torpedo factory at Chatham is about to be taken down, the site being required for the new naval barracks. The works will be removed to a spot near Gillingham Pier.

REVISED plans were submitted at the meeting of the Renfrew Town Council for approval in regard of works for the Joint Hospital Board, the probable cost to be 7,000*l.*, with a further expenditure of 500*l.* for furnishing.

AT the meeting of the Fife and Kinross Asylum, it was agreed that the large new wing of the asylum should be connected with the main building by covered ways, which it is expected will cost about 1,000*l.*

AT their meeting the Govan Town Council considered the report of a sub-committee recently appointed to inquire as to the accommodation provided for the official departments of the burgh work, and as to the cell accommodation in Paisley, Coatbridge, Leith, Dumbarton and Partick. As the result of their investigations the committee gave it as their opinion (1) that the burgh departments in Govan should, if possible, be more centralised; (2) that the accommodation in Albert Street was deficient; (3) that the fire-station required enlargement and rearrangement, and (4) that more accommodation should be

provided for board and committee meetings. The report was adopted and ordered to lie on the table for a month.

IT is proposed to convert the drill hall, Swansea, into a theatre. Messrs. J. P. Jones & Rowlands, architects, Cardiff and Swansea, are preparing the designs.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE annual dinner of the Builders' Clerks' Benevolent Institution was held on the 9th inst. Mr. Charles Wall presided. He stated that the total income for the past year was 808*l.* The annual subscriptions amounted to 227*l.* 6*s.* 8*d.*, while the donations came to 326*l.* Dividends brought in 128*l.* 4*s.* 3*d.*, and a legacy of 250*l.* was bequeathed to the society by the late Mr. Thomas Robinson, of which one moiety, namely 125*l.*, had been paid. They all knew that as each Christmas came round it not only added to one's age, but took a little off one's stability and physique. Builders' clerks were no exception to the rule, and those who fell out of line had to be looked after in a proper manner. Referring to old age pensions, he said he feared they were still a great distance off. In addition to the clerks there were widows whom the institution assisted. It was a distressing thing for a family to be bereft of its head and support, but it must be a pleasing thing for a widow to know that her late husband's friends would come forward to help her. It was also necessary to remember the orphans. At present the number of pensioners was nineteen, and there were some orphans in the Orphan Working School at Haverstock Hill. These were entirely dependent upon the institution for support. Mr. Wall concluded by commending the institution to the company's generosity. The secretary afterwards announced that the subscriptions amounted to 272*l.* 17*s.*

THE BLACKWALL TUNNEL.

THE Blackwall Tunnel under the Thames has been pushed forward, says the *Standard*, with great rapidity and with remarkable success. Messrs. S. Pearson & Son, who had driven 2,000 feet of the tunnel under the Hudson River, for the purposes of the Blackwall operation have developed and carried out the shield arrangements upon a more extensive scale and with increased perfection of details, adequate to the requirements of the vastly greater magnitude of the present undertaking. The operations which are now going on are

upon a scale not heretofore witnessed. Long open approaches are hoarded off from the streets; huge iron shafts in process of being sunk into the earth rise like round towers above the houses; and great open spaces of waste ground are covered with engine sheds, cranes and other appliances for the subterranean burrowings. All the intercourse between the two sides of the river has in the past been carried on by little ferry skiffs, which are still the only means of transporting very occasional passengers at fourpence a head for the waterman's toll. The new tunnel will run from the entrance of the East India Docks on the north to the Greenwich marshes on the south side of the river, the idea being to shorten the distance from Woolwich, Deptford and Greenwich to the docks, and otherwise open out a large tract of land covering many hundred acres on the Greenwich side for dwellings for the working classes. The London County Council has acquired considerable areas, and has already built several blocks of buildings and erected some cottages at the head of the Blackwall Lane on Greenwich Marsh.

The tunnel and its approaches are 6,200 feet in total length. Commencing close to the East India Docks there is first an open cutting 785 feet long, gradually descending with a gradient of 1 in 34. From this there is a cut and cover length of 436 feet. The tunnel proper follows for 891 feet from the centre of the No. 1 shaft. This shaft, which is typical of the others, is composed of an iron caisson, of 58 feet outside and 48 feet inside diameter, the interspace between its two skins being infilled with concrete. Its depth is 80 feet. At this point the tunnel deflects to the left, and reaches its maximum depth at a further distance of 447 feet. Shaft No. 2 is sunk to 100 feet. From this point the tunnel is level across the river, the depth of the roadway being 72 feet below Trinity high-water mark. The portion of the tunnel passing under the river is 1,212 feet long. Shaft No. 3 has been sunk to its final level, and the tunnel driven through it under the river-bed. The advance of the tunnel to 700 feet brought it within 6 feet of the river-bottom, where there was nothing but flint ballast. Over this dangerous part the Thames Conservators have allowed the contractor to put 10,000 cubic yards of puddled clay. From No. 3 shaft the tunnel begins to rise again, the gradient being 1 in 36 for 602 feet. This piece has already been completed to No. 4 shaft, which has been sunk to a depth of 80 feet. On the land side of No. 4 shaft there are 946 feet of cut and cover completed, and 860 feet of open approach. The tunnel and cuttings will be lined with glazed white bricks or tiles above the foot-

path. It is 24 feet 3 inches internal diameter, and the traffic roadway through it is 16 feet wide, the curved space beneath it being adapted as a subway for gas and water mains and electric leads. There are two footpaths, one on each side, 3 feet broad.

The tunnelling operations were begun on the Kent side, on account of information derived from the borings, which showed that the London clay existed there as a much more regular bed than on the Middlesex side, and formed a watertight cover to the subterranean workings. The rapid progress made under the river is notable, the rate of advance of the heading having been about 57 feet per week. As much as 500 feet was done in the first two months, and the *débris* carted away has exceeded the largest quantity ever taken out of any other tunnel. Since the employment of cotton-powder as an explosive, as much as 67 feet 6 inches advance has been made in one week. The engines originally employed for compressing the air developed nearly 2,000 horsepower, but this has been increased to meet emergencies in keeping out the influx of the river since the dangerous gravel crux was encountered. The working pressure of the air at the face of the shield is over 23 lbs. to the square inch, as shown by the barometer rising to 6 feet 9 inches of mercury. The shield is 27 feet 8 inches in diameter, and 19 feet 6 inches long, weighing 250 tons. It is propelled by twenty-eight hydraulic jacks, each capable of exerting 120 tons, or, all collectively, over 3,000 tons pressure, to force the cutting rim of the shield into the unexcavated soil before it. There are twelve working compartments in it. The miners first cut out the centre of the soil face; then cut out other parts around; and, finally, the cutting rim of the shield is forced forward and brings down the circumferential or outer ring of soil. The *débris* is taken away in trucks; and, as the heading advances to the extent of 2 feet 6 inches, the hydraulic erector lifts up consecutively the fourteen iron segments which form one ring of the circular iron tunnel and places each in position. Being planed at the edges to a close fit, they are bolted together through their flanges, a key-piece being inserted to complete the arch. The full ring weighs 16 tons. Grout is forced through holes in the ring to fill up the interspace between the outside of the iron tunnel and the inside of the larger boring made by the cutting rim of the shield. The interior of the tunnel is concreted to a plain surface, for the reception of the white glazed tiles.

A diaphragm provided with air-locks is built across the tunnel behind the shield, to retain the compressed air, and to

preserve the completed work from inundation. This diaphragm is shifted forward as the construction of the tunnel proceeds. Provision is also made for the personal safety of the miners by a hood connected with the shield, which will preserve breathing air in case of an inrush of water, and further means is afforded for the men to get through to the air space in rear of the shield. Working under such severe air-pressure renders men with any defects of heart action liable to paralysis of the lower portion of the body, and provision is wisely made within an iron boiler-shell for a hospital for two or more persons, where they can be properly treated by being again put under air-pressure and relieved gradually, as is needful in such cases. Hot coffee is also constantly ready, and a man always in charge of the arrangements. The miners work in shifts of eight hours, but have an interval of three-quarters of an hour in the middle of that period, and hot coffee is served to them at every half-shift. Every possible care seems to be taken of the workmen by the contractors, and no serious case of illness has yet occurred. Lady Pearson has had an iron chapel erected for Sunday and other services. The practical work is under the charge of Mr. E. W. Moir, who has had the most valuable experience of the American operations already referred to, in which he held the position of contractors' engineer, as he now does under the same firm at the Blackwall Tunnel. The resident engineers on behalf of Mr. Binney, the engineer-in-chief to the London County Council, are Mr. David Hay and Mr. Fitzmaurice.

THE ELECTRIC LIGHT IN EDINBURGH.

THE electric light was turned on on the night of the 11th inst. in Edinburgh for public purposes amid a great display of popular interest. In the afternoon, at five o'clock, says the *Scotsman*, an opportunity was given to a large number of leading citizens—mostly probable customers in the compulsory area—to inspect the new central electric station, and on the occasion short speeches were made by Lord Provost M'Donald, Councillor Mackenzie, chairman of the electric light sub-committee, and Professor Kennedy, the Corporation's consulting engineer, in which explanatory statements were made regarding the present installation and the financial prospects of the scheme. On the latter point the most sanguine hopes are apparently entertained, the applications for the light having exceeded what were looked for by the committee and the consulting engineer at this early stage of the undertaking. So far

as the general public were concerned, however, the part of the ceremonials which interested them most was seeing the light actually turned on. After the ceremony at the central station, the members of the Corporation and officials dined together in the Rutland Hotel in a room on the first floor, the windows of which commanded an uninterrupted view of Princes Street. Shortly after seven o'clock a large crowd began to assemble outside, and by eight o'clock—the hour fixed for the ceremony—the whole of the neighbourhood of the "Four Lamps" was filled by a compact mass of people. The size of the crowd made it quite impossible to estimate the number in it. It was with the utmost difficulty that vehicular traffic could be maintained at the West End. The crowd stretched away down the street and into Lothian Road, and was regarded as in size to be one of the largest seen on the streets of Edinburgh for many a day. It was quite dark at eight o'clock. In the Rutland Hotel a wire had been carried from the central station, upon which was a switch and lever by which the current was to be sent coursing down the street. The electric light committee had requested Mrs. M'Donald, the wife of the Lord Provost, to perform the ceremony, and by her the light was turned on in the most purposelike way. The switch was fitted up on a table in one of the windows, and was embedded among flowers. Professor Kennedy, who had set the time at the central station, sat, watch in hand, waiting until the hour was reached. In the meantime the loyal and patriotic toasts had been pledged, and success had been drunk to the electric light scheme amid enthusiasm. Then there was a pause for a minute, and great was the excitement both inside and outside the hotel. "Now," called Professor Kennedy, and in response to the invitation Mrs. M'Donald pulled the lever, and as if by magic the current flashed along the street; the lamps were lit from end to end almost as quickly as the eye could look along the length of the thoroughfare, the darkness was illuminated, and a ringing cheer, begun in the hotel, was caught up by the crowd, and went surging along the street as the invisible current had done a moment before. The inauguration had been a great success, and upon it Professor Kennedy and Mr. Mackenzie were heartily congratulated. For an hour or more after the ceremony the crowd showed little signs of diminution, but instead of concentrating themselves at the West End they walked along the street and enjoyed the well-lit promenade, on which, on the north side of the street, faces could be discerned with

4 Great Winchester St., London, E.C.

The Electrical Power Storage Company takes this opportunity of informing its customers and the public generally that E. P. S. Batteries are manufactured under a number of Patents in its possession, and that no classes of its manufacture in any way infringe the valid Patents of any other Makers, and that on request a guarantee to this effect will be supplied to every buyer of an E. P. S. Battery.

nearly the plainness of midday. The south side, where there are no lamps, was much better lighted than it used to be under the old gas-lighting; but it was noticeable that a very deep shadow was cast into the gardens, which rendered it well-nigh impossible to make out any of their features. The street looked splendidly, and it will show even to more advantage when the old lamps are removed and private lamps are lit up, as they inevitably must be at no distant date, with the electric light.

BUILDING IN GLASGOW.

At the last meeting of the Glasgow Dean of Guild Court, the busiest that has been held for over twenty years, there were no fewer than seventy-eight applications for linings, the cases alone representing 138,000*l.* worth of new property which it is proposed to erect in the city. A lining was granted to Messrs. Howard & Wyndham, theatrical proprietors, to restore and reconstruct the Theatre Royal, in Cowcaddens, Hope Street and Rutherford Lane. Although the interior of the new house will be similar to that which existed before the fire, the plans provide for several important alterations in details which will conduce to the public safety and comfort. Mr. C. J. Phipps, architect, in his designs has had specially in view the prevention of fire. The auditorium and the stage will practically form two separate buildings. The gable which formerly divided the two parts will be allowed to remain and constitute the boundary of the auditorium. A new wall will be erected 10 feet behind, and will form the boundary of the stage, thus giving practically a double proscenium wall, and avoiding contact between the roof of the auditorium and the roof of the stage. The whole of the opening of the stage will be filled up by a fire-resisting curtain, 3 to 4 inches thick, made of iron framework, covered on both sides with asbestos boards three-eighths of an inch thick, and filled in solid with silicate of cotton. This, in the opinion of Mr. Phipps, will afford the greatest possible protection to the public, because supposing any accident should arise on the stage, where a fire usually breaks out, all danger will be removed from the sight of the audience, and a panic thereby avoided, as the curtain can be lowered by hydraulic pressure in 40 seconds. In Mr. Phipps's opinion the stage might be burned out and the auditorium remain safe. The present staircases will remain, but they will be roofed with concrete. The auditorium will accom-

modate about 3,000 persons, an increase of 500 on the old house. Three hundred seats will be added to the pit, and the gallery will be reduced in size to allow of a refreshment-bar being provided on the top floor. The boxes will remain the same, and will have emergency staircases leading to the street. The old horse-shoe dress circle will have less of a sweep, being brought nearer the stage. The chairs will be on a greater slope, thus commanding a better view of the proscenium. The corridors are to be of concrete, as well as the passages to the dressing-rooms and the dressing-room staircase, and the gallery and upper circle stair covered with concrete at the top. The flies on both sides of the stage are to have double iron doors. The roof of the auditorium is to be lowered 6 feet, and the depth of the stage is to be slightly less than formerly. The entrances to the theatre remain the same, the main entrance being from Hope Street, and access to the pit and gallery being from Cowcaddens. The new Theatre Royal is expected to be one of the best equipped and most comfortable in the kingdom, and to this end about 20,000*l.* will be spent. Messrs. Morrison & Mason are the contractors. Special efforts will be made to complete the house by September 6 for the engagement of Mr. George Alexander, who will open the theatre.

Plans were passed authorising the formation of a new feuing road to the west of the Glasgow Skating Club's pond. This road, which is proposed to be called Whittingehame Drive, is situated on a pleasant rising ground, and has been laid off for the erection of villas of moderate size and price. A demand exists for houses of the class proposed to be built in Whittingehame Drive.

THE NATIONAL PORTRAIT GALLERY.

The new building, the designs for which the late Mr. Ewan Christian was commissioned to make in 1890, and the erection of which was commenced some four years ago, is now near completion. The structural portions are finished, and only the minor and ornamental details remain to be executed. These will still occupy some time, but it is expected that the edifice will very shortly be out of the contractors' hands. The site is the irregular plot of ground adjoining the east and north-east end of the National Gallery, and abuts on the Charing Cross Road, at its southern end by Trafalgar Square. The main block, 150 feet in length, faces the north, and is 67 feet in

depth. The eastern block, at right angles to the former, has a frontage of 140 feet, and a depth varying from 16 feet to 27 feet. The whole edifice is of Portland stone, with grey Cornish granite base, and with its broad and severe treatment, and bold, simple mouldings, has architectural features of marked excellence. The principal entrance is placed in the north-east angle between the northern and eastern blocks, and thus is made to mask the differences of style of the two portions. It consists of a semicircular arch in polished grey Penrhyn granite, with the Royal Arms, carved with more than usual spirit, in the tympanum over the doorway. The rise from the level of the pavement is made by eleven steps to the entrance-hall of the ground floor. Passing to the left, the long Sculpture Gallery of the east wing is entered, well lighted from the windows in the east front. Going further up the main stairs, which are 11 feet broad, with descending flights on each side 7 feet wide, and turning to the right, we enter the reference library of works containing portraits, and the Miniatures Gallery, with its table cases. Adjoining are the board-room and administrative offices, very conveniently arranged. Continuing the ascent by the principal staircase, the first floor is reached, passing at midway the access to the east wing. This part of the east wing contains a large picture gallery, 42 feet by 20 feet, a narrower gallery of 33 feet and a semicircular gallery, 26 feet by 25 feet, all these galleries being for water-colours or loan collections. On the first floor of the northern building are an eastern corridor and a central corridor, with separate galleries, some 40 feet by 20 feet, on each side. These will be mainly devoted to cabinet-sized pictures. There is also on this floor a repairing-room for the pictures and their frames, with a large lift for their transmission to it from below. Ascending again by the principal stairs, the top floor is reached, the stairs terminating in a very charming stone arcade, through which are seen the windows which light the side stairs. The central stairs are lighted by large windows in the external wall, their lead patterns being filled very prettily with white Venetian glass. The landings and entrance hall are paved with marble mosaics, which present a roughened surface, like that which gives to the old Roman mosaics their characteristic appearance. The upper floor is the principal one for pictures. It is divided into a number of galleries, there being three 40 feet by 20 feet, and one long one 58 feet by 18 feet; also seven smaller galleries, the whole of which are lighted from the roof. All the galleries throughout the edifice have their brick walls lined for about 10 or 12 feet with wood, so that the pictures may be

fastened direct to them without cords or rods, and can be removed or changed as desired. The galleries on the upper floor are about 15 feet in height to the coving; this adds 4 feet vertically up to the bases of the skylights, which are dry-glazed, and have each slope inclined at a proper angle for showing off the pictures. The galleries on the first floor and on the ground floor are 16 feet in height. The ceilings are everywhere very chastely and slightly ornamented. The woodwork of the interior doorways and doors, the friezes, the panellings over the ventilating arrangements and the floors are of teak, rubbed down and waxed, and the mouldings are bold and simple. The screens are splayed so that the light derived from the windows properly illuminates the pictures placed upon them. There is also a photographic gallery, well lighted from above, for the copying of pictures, and a second picture-cleaning room and accommodation for students. There are also special entrances, passenger-lifts, and other very convenient arrangements. Further, on the upper basement is a very fine gallery, with wall space for a large picture 35 feet high, rising through the ground floor, and well lighted by three side windows and top light. The lower basement contains the boiler-room, the engineer's and police rooms, and the stores. The flat roof is a fine specimen of cast lead work, and is divided by numerous flat gutter ways, all delivering towards the south side, the down pipes being of earthenware, for the purpose of avoiding the expense and difficulties of the repeated paintings required by iron pipes. Extraordinary care has been taken for the security of the massive cornice, some of the corner stones being of immense size, and all the others having a full and firm grasp right across the entire thickness of the walls, which are no less than 3 feet in thickness. The style of architecture cannot be classed as of any particular order, but it is well suited to the purposes to be provided for. The façades have commanding aspects. The two tiers of broad windows, with the medallions above them, afford quite sufficient decoration, without cutting up too much of the ample breadth of wall-surface. The medallions contain each of them the head and face of some eminent personage, commencing at the west end with Chantrey and terminating on the east with Vandyke, the series including Earl Stanhope, who may be regarded as the founder of the institution. Although the Gallery will not be opened to the public before June, some of the saloons have been handed over to the authorities, and some of the pictures have been brought in to afford trials of the most favourable spaces for their display.

EFFICIENCY SKYLIGHTS.

WHEN Cowper said that whoever loves a garden loves a greenhouse too he expressed a national feeling. Since the poet wrote the greenhouse has become more of a domestic institution, and it is to be seen in varieties corresponding to the necessities of nearly all classes. It is possible to have one of very simple construction, and indeed the simplicity offers a temptation to people of moderate means which is irresistible. If subsequently they discover that simplicity does not necessarily mean economy or insurance, a corresponding fact is afforded by many other kinds of work.

There is, however, a fascination about the roofing of which the greenhouse is a species which must always tempt men of constructive abilities. Whether seen in a railway terminus or in a cottage conservatory, the conditions of the problem are alike. It is necessary, in the first place, that the roof should have great rigidity, and yet be light. As glass cannot be kept from breaking, it should be replaced with ease. Drainage is also important, including the carrying off of condensation. All the qualities that are desirable appear to be found in the new and patented system of the Paradigm Construction Co., of 1 Great College Street, Westminster.

In the first place, the main bars are of steel and of channel section; they are, in fact, miniature girders. The employment of a similar but larger section as struts for railway and other bridges is evidence of the stiffness of the form. When employed in roofing it has the advantage of serving for drainage. It may be objected that the section would form a receptacle for dust, but one of the advantages of the Paradigm system is that it can be covered by a sloping cap of copper, which not only preserves it, but especially in the case of roofs which are entirely visible becomes a pleasing addition to the general appearance. If desired, a flat cover of iron with lead or copper can be substituted. The channel iron is attached to the purlins by small angles. On the bars the plates of ribbed glass rest. From the flexibility of the copper caps there is no difficulty in removing or replacing the glass. The joints are also protected and supported by sheet metal bars, which are most ingeniously devised for their special purpose of support besides serving as drainage. If it be desired to obtain immunity from broken glass, copper, brass or iron wire mesh can be stretched between the main bars and secured in the simplest way by cross pins. In fact, the whole arrangement is scientific construction, for contingencies are provided for and

safety is secured. It is no wonder, therefore, the system has found favour with many of the leading engineers in America, and areas varying from 10,000 to 45,000 square feet have been covered without extraneous aid. In the power house of the Edison Company at Chicago the Paradigm skylights have a superficies of 15,000 feet.

No less remarkable is the economy not only in first cost, but from the arrangement of the glass and the use of the steel channel bars and the absence of any contraction or expansion which affects the glass, breakage is minimised. The system has an appearance which will satisfy the most fastidious and offers a security which cannot be questioned by anyone who is familiar with the principles of construction.

GOWTHWAITE HALL.

THE Bradford Waterworks in the Nidd Valley during the winter were not only almost at a standstill, but had some of their works greatly jeopardised by the floods, without, however, suffering to the extent that was sometimes feared. Work is now resumed, says the *Leeds Mercury*, and the coming summer, it is expected, will bring great activity into the dale. The construction of the Gowthwaite compensation reservoir has been a very unwelcome intrusion to the farmers, inasmuch as it is to cover what have been the best pieces of their holdings, and moreover in some cases necessitates the removal of the homesteads to higher and more exposed situations. A portion of the highway from Pateley Bridge to Ramsgill and Middlesmoor will become submerged, but this can hardly be counted a disadvantage to the locality, for it is one part of the scheme that this shall be replaced by a more level and less sinuous road, which for the purposes of locomotion, if not from a scenic point of view, will be an improvement upon the old. The site of the reservoir would in the ordinary way include the site on which Gowthwaite Hall now stands, and in the earlier negotia-

tions with the Corporation the owner (Mr. Yorke, of Bewerley Hall) evinced a very natural desire to save from demolition the venerable Elizabethan manor house, which from its erection about the end of the sixteenth century for about 150 years was the home of his ancestors, who then, as now, were the principal landowners of the dale. These wishes were shared also by inhabitants of the dale. In addition to its connection with an esteemed and old local family, Gowthwaite Hall has associations with some of those who in the past have been amongst the most liberal benefactors of the neighbourhood. Mention may be made of Professor William Craven, D.D., scholar and philanthropist, to whom and his kinswoman, Miss Alice Shepherd, the Raikes School at Wilsall owes its endowment. He was born at Gowthwaite Hall in 1730, and it detracts nothing from the interest of the old hall when we add that he was one of several more or less distinguished men who at this house received their first education from the notorious Eugene Aram, whose marriage is chronicled in the Middlesmoor parish register. Possibly the dearth of great names associated with the dale's history may have caused the people of Nidderdale to magnify above its merits the name of Aram, but surely they have excuse when Lytton and Hood have not deemed it beneath

them to immortalise him in their writings. At any rate it cannot be gainsaid that the people of the dale much desired the retention of the old hall, and a sense of relief was felt when it was understood that Mr. Yorke had arranged with the Corporation for an embankment to be made to keep the reservoir from the house, which must then have somewhat of the nature of a peninsula abutting into the reservoir. The difficulties of keeping the water entirely clear of the place are, however, so formidable that the representatives of the Corporation have, we understand, at last prevailed upon Mr. Yorke to withdraw his objections, and the hall is now doomed, Nidderdale thus losing one of its most venerable old houses which added so much to the picturesqueness of this part of the dale.

PURCHASE OF OLD MATERIALS IN GLASGOW.

AN action was lately taken by Mr. McDougall, timber merchant, Glasgow, against Messrs. Land & Sons, auctioneers, about the sale of old building materials of Improvement Trust property in Saltmarket. The plaintiff purchased building materials to the amount of 243*l.*, and a deposit of 30*l.* was made for the fulfilment of the conditions of sale, which provided that the purchaser of the stones and bricks should erect a barricade at his own cost and clear away the rubbish after demolition of the building. Some delay took place in erecting a barricade, which ultimately was put up by the Improvement Trust at a cost of 21*l.* The plaintiff sued for repayment of the deposit of 30*l.*, and the defenders pleaded a counter-claim to the amount of 44*l.* 19*s.* 4*d.*, being the cost of the barricade, ground rent, cost of removing the rubbish and other charges, and further that the plaintiff's action was barred on account of the clause of reference in the conditions of sale appointing James Laird, a partner in defendants' firm, as judge of the sale and arbiter in any differences that might arise. The defendants' preliminary plea was sustained by the Sheriff-Substitute and Sheriff-Principal, but on appeal to the Court of Session the First Division held that the auctioneer, being a partner of the defendants' firm, was barred from acting as arbiter in regard to the questions in dispute, and remitted the case to the Sheriff-Substitute to hear proof. Sheriff Balfour has decided that the plaintiff is only liable for 10*l.* for the use made by him of the barricade and 3*l.* 1*s.* 10*d.* for watching and lighting the same, and 9*s.* 6*d.* for

removing slates, and has found the plaintiff entitled to two-thirds of the expenses. In a note his lordship says that by the conditions of sale the purchaser of stones and bricks was bound to erect a barricade at his own expense, and light and watch the same to the satisfaction of the master of works. The sale was on December 4, and the custom in removing building materials was that before the stones and bricks were removed the lead-work and the doors and windows were taken away. The barricade, therefore, was not put up at once; and although it was provided by the conditions that slates and certain other materials (which rendered a barricade necessary) were to be removed within three days after the day of sale, this was impracticable, because by the Building Regulations Act the pursuer had after seven days' notice to get the consent of the master of works to the erection of the barricade. The plaintiff or his agent delayed to erect the barricade, and in the meantime an accident occurred in connection with the taking down of the buildings, which was reported to the master of works, and he at once instructed the manager of the Improvement Trust to erect a barricade. Before this, however, the plaintiff and his brother had called upon Mr. Whyte, the master of works, as to the barricade, and Mr. Whyte promised to inspect the buildings. But the barricade was erected on December 13, before he made his visit. The barricade was made of new wood, and the Sheriff had no doubt that the plaintiff, if he had erected it, would have used, or attempted to use, the old materials in the buildings, and this would have been done at a trifling cost. But, according to the conditions, the work had to be done to the satisfaction of the master of works, and he condemned the use of old materials for a barricade, and the Sheriff must therefore take it that the outlay of 15*l.* odd incurred in the erection of the barricade was a proper charge. The barricade, however, was afterwards utilised by the Improvement Trust by being put back to the building line in order to protect alleged excavations made by the plaintiff, and ultimately it was used after the buildings were taken down as a barricade for the new buildings of the Improvement Trust. It had not been proved to the Sheriff's satisfaction that excavations existed which required protection, and he thought that as the Improvement Trust ultimately used the barricade for their own purposes the plaintiff should only pay 10*l.*, being two-thirds of the cost, leaving the Trust to bear the other third. The claim for damage done to the pavement and for the removal of rubbish was disallowed, because it was not proved that the

OPTIMUS SUPERIOR PHOTOGRAPHIC OUTFITS.

EXTRA LONG FOCUS CAMERA.

British Journal of Photography says:—"The present model Rayment Camera is among the very lightest of actually rigid cameras offered to the public. The rapidity of opening and closing is greatly facilitated by the additional arrangement for throwing the pinion out of gear from the rack. There is no curtailment of view when lenses of short focus and wide angular aperture are in use. All movements necessary to the modern scientific photographer are included in this compact instrument."

pursuer's workmen broke the pavement. There was no proof of what the plaintiff failed to level, there was no complaint made to him at the time and the ground was naturally very uneven. The claim for rent for the extra time during which the pursuer occupied the ground appeared to be novel, and the conditions of sale did not provide for any such charge being made. He must hold that in practice the purchasers of building materials were allowed some latitude in removing them, and no charge of rent was made for extra time in removing. The further claim for extra trouble involved by the defendants in visiting the ground was not recoverable from the plaintiff. There was nothing said in the conditions of sale about such a charge, and Mr. Laird must be held to have been acting for the Improvement Trust.

PUBLIC WORKS REFORM IN EGYPT.

It is announced by the correspondent of the *Times* that on Monday the Khedive in Council approved of the scheme drawn up by Mr. W. E. Garstin, Under-Secretary of State in the Ministry of Public Works, for the reorganisation of the Tanzim—a branch of the Public Works Department—which has been for years the subject of much adverse criticism on the score of inefficiency and extravagance due to its centralisation and formalism.

The scheme provides for a complete system of decentralisation, with a division into two branches—one for ordinary repairs and the execution of small works, and the other for the control of all new works costing over 1,000l. The former branch consists of two inspectorates for Upper and Lower Egypt respectively, which are subdivided into directorates under directors residing in the provinces, instead of in Cairo and Alexandria as has hitherto been the case, the powers and responsibility of these directors being at the same time greatly increased. The latter branch will design, make estimates for and control all new Government buildings costing over 1,000l., and will be in charge of Messrs. Hewat and Clifton, who are transferred from the irrigation service. M. Roux, another irrigation official, becomes inspector of Lower Egypt. The cost of this important change will be only about 2,000l. above the present expenditure, which will be amply recouped by the increased efficiency of the department.

PORTLAND CEMENT: SOME POINTS IN ITS TESTING, USES AND ABUSES.

(Concluded from last week.)

CEMENT is very extensively used in the manufacture of moulded or purpose-made materials, such as paving-slabs, &c. When properly manipulated, with a suitable aggregate, no more satisfactory and economical method of producing these articles can be wished for; but in particular, again, experience and manipulation play a very important part. In making this remark, the author has in mind a sea-wall and esplanade which has come under his notice at a watering-place on the South Coast. The esplanade is formed entirely of concrete paving-slabs, made by the local authorities, the sea-wall being composed of shingle concrete, faced with a coating of richer material, and the whole work forms a perfect example of what can be done with a cement concrete. Within a few miles there is a work of a similar nature, carried out with exactly similar materials, but which work is considerably inferior in appearance, a result that can only be attributed to less experienced manipulation. In making paving-slabs for work of this sort, it is usual to face the top and bottom with about half an inch of richer material, so as to form a more presentable appearance when laid in position, and by making this face on the under side as well, it is possible, when the top has become worn, to reverse the slab, thus doubling its period of usefulness. In such work, where appearance is of considerable importance, it is found advisable to keep the blocks sheltered from climatic influences as much as possible, and during dry weather to moisten them occasionally with water, which is found to preserve their colour to a great extent.

A use for cement, which concerns the architect perhaps more than the engineer, is plastering or rendering the walls of buildings, although a similar use of the material sometimes occurs in the case of reservoirs. In such cases it is most important that the cement should be thoroughly matured and cool, and also that the wall or surface to be rendered should be thoroughly wetted before the plaster is applied, so that the cement shall not be deprived of any of the water necessary for its proper setting and hardening.

The abuses of cement are perhaps not quite so numerous as its uses, but the treatment which it sometimes has to undergo at the hands of inexperienced users makes it a matter for wonder that failures are not more frequent. One of the most

prolific causes of failure is insufficient attention to the setting properties of the cement under treatment. In very hot weather it is no uncommon thing for a cement to have a very quick initial set, and in using such a cement, therefore, in order to obtain its full strength, it must be mixed and in its allotted position within a very few minutes of adding the water. This often entails the mixing of very small quantities at a time, and if due precautions are not taken a larger quantity is mixed than can be manipulated before setting commences. This generally results in the use of additional water, and the serious detriment, if not total destruction, of the setting properties of the cement. Many cases of failure have occurred, in which the cement being of good quality, though somewhat quick setting, point strongly to over manipulation or "killing."

Another frequent cause of unsatisfactory work is a dirty and unsuitable aggregate. The admixture of a very small proportion of dirt or loam is quite sufficient to materially deteriorate the strength of a concrete, and too much stress cannot be laid upon the necessity for seeing that all aggregates are free from any foreign dirty matter. A case of structural failure came under the notice of the author a short time back, in which the cement used was perfectly good, but the finer portions of the aggregate consisted of very fine sand, so fine that 60 per cent. passed through a sieve having seventy holes per lineal inch, and 80 per cent. through a sieve having fifty holes per lineal inch. The structure of which it formed part had to bear a considerable thrust, and to aggravate matters, instead of this sand being properly mixed, large patches occurred in which there was no cement at all. In addition to this, the sand contained a considerable portion of loam or foreign matter, and it is not to be wondered at that failure resulted.

The neglect of the proper cooling or aeration of a cement is a frequent cause of trouble, and to insure satisfactory work proper cooling cannot be too strongly insisted upon. Of course cement may give good results when used hot from the mill, and the author has manufactured cement which has turned out satisfactorily under these conditions, but to use cement in this state is to court failure. It is sometimes specified that the manufacturer shall store the cement in his warehouse at a stated thickness of, say 3 feet, for a certain period, and have it turned over three or four times at regular intervals before being supplied for use, but if this had to be done with the entire output of every factory it would necessitate an enormous increase in warehouse room, to cover the first cost of which would entail a largely-increased price to the consumer. It is there-

fore advisable, where cement is being used in considerable quantities, to construct temporary cooling sheds, with a good dry boarded floor, where the cement can be turned out of the sacks or barrels and thoroughly aerated before use. It is sometimes contended that the cement, even if shipped hot, cools sufficiently during transit. Although it undoubtedly does cool to a certain extent, it is doubtful if, when tightly packed in barrels, or closely stowed in sacks, it cools sufficiently to allow of its being immediately used with safety.

The exposure to extremes of temperature has perhaps more to answer for in the shape of unsatisfactory work than is generally recognised. If exposed to a summer sun immediately after being gauged, naturally a great deal of the necessary moisture is evaporated, leaving the cement without sufficient to complete the crystallisation already set up. The result frequently is that the work crumbles, and shows signs of failure. On the other hand, exposure to frost acts on the water, and by expansion, destroys the surrounding concrete. The author once had occasion to investigate a case of failure in which frost was the undoubted cause of the mischief, as there was no fault to be found either with the cement, aggregate, or manner of manipulation. The concrete flooring of an outhouse in some new farm buildings was commenced late in December, and left partly completed owing to the Christmas holiday. As frost set in with unusual severity during the interval, the work was not revisited until the return of milder weather, three or four weeks afterwards, when it was found that that portion which was laid immediately before the frost was utterly destroyed, while the portion previously laid, which had sufficiently hardened to prevent total destruction, showed signs of flaking on the top where it had been floated or trowelled. In this case the cement had to bear the blame, although the destroyed portions, afterwards relaid with the same materials, gave perfectly satisfactory results. During severe weather, therefore, proper precautions should be taken to protect freshly-laid concrete from the effects of frost.

A matter which has lately attracted a large amount of attention, among those interested in the English cement industry, is the use of admixtures with the Portland cement clinker after calcination. At a meeting of manufacturers held on November 12, 1894, for the purpose of forming an English Cement Makers' Association, this matter of admixtures was brought forward, and one manufacturer boldly averred that a certain admixture improved the quality of Portland cement, and that his firm had therefore adopted it in their ordinary manu-

facture. As the outcome of this meeting the cement trade section of the London Chamber of Commerce took the matter up, and a committee has been appointed to investigate the question.

The one material about which the controversy chiefly rages is Kentish rag, a limestone of varying composition found near Maidstone. From samples of cement containing a certain addition of this limestone, which have been sent to the author for testing in the ordinary course, the results by the usual methods of mechanical testing compare favourably with average English cements, even when gauged with three parts of standard sand, though of course what results they would give without the admixture he has had no opportunity of judging. He has, however, instituted a considerable series of experiments on the subject, extending over a lengthy period, and when these are completed he will be able to speak more definitely on the matter.

The same question of admixtures arose in Germany a few years back, where adulteration was then largely practised, and the results of experiments, carried out under the auspices of the German Cement Makers' Association, seemed to prove that admixtures of any sort detrimentally affected the cement, and, as a consequence, a resolution was passed by which the members of that Association bound themselves not to use any admixture whatever, an exception being made in the case of gypsum, of which 2 per cent. was allowed to regulate the time of set. On the other hand, Professor Tetmajer, of Zurich, obtained very different results from those of the German Association. With certain admixtures he obtained equally good and in some cases better results than with the pure cement.

Until, therefore, we have more conclusive independent evidence in their favour, it seems questionable whether admixtures of any sort are desirable. As, however, such admixtures, and more especially Kentish rag, are easily detected by analysis, the user, at all events, has it in his power to discriminate between the ordinary calcined product and that containing an admixture.

To summarise the preceding remarks, apart from the question of admixtures, the chief points requiring attention in the use of cement in order to obtain the best results are the following:—1. Sound, well-ground cement of steadily-increasing strength; 2, due attention to the setting properties of the cement; 3, clean, well-proportioned aggregate; 4, proper maturing of the cement before use; 5, protection from extremes of temperature. In conclusion, the author ventures the opinion

that if the above points always received the amount of attention due to their importance, failures in cement-work, apart from defective design, would very rarely be heard of, and if the statements made in this paper, based as they are on personal experience, lead to a better general knowledge of the properties and capabilities of Portland cement, its object will be amply fulfilled.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 6631. William Willis, for "Improvements in flushing cisterns."
- 6645. Thomas Wilkinson Mason and Daniel Binks, for "The combination sanitary water-closet seat."
- 6686. Charles Bristow, for "Surveyor's roadside ruler."
- 6809. Arthur Nicholls and Anthony Boiston, for "Invisible door-springs and checks."
- 6830. James Stanley, for "Improvements in window-sash fastenings."
- 6860. Robert James Irving and John Bell Irving, for "Improvements in or appertaining to gates, doors or the like."
- 6902. John Edward Lucas, for "Improvements in locks (mortise and others) or latches."
- 6907. Frank Smith and Charles Gray Smith, for "Improvements in locks and bolts."
- 6994. Harvey William Lardner, for "Improvements in gate fastenings."
- 7055. Amos Fisher, for "Self-acting burglar-proof window fastener."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

ORNAMENTAL.

For CHURCHES, CHAPELS,
HALLS, SCHOOLS, &c.

SUGG'S

PATENT HIGH-POWER

SUSPENSION GAS LIGHTS, 90 to 600 Candle Power.

ADVANTAGES:—

(1) BRILLIANT, WHITE, SOFT LIGHT.

These lights are fitted with patent vertical flat-flame burners, which develop a much higher illuminating power than is obtainable with horizontal flames. They are also fitted with Opal Glass Reflectors.

(2) GREAT SAVING OF GAS.

The consumption is far less than under the old system.

(3) NO FLARING OR FLICKERING.

The burners are controlled by a patent Automatic Governor, and the flames are perfectly steady, being protected by the glass screen.

ADOPTED BY MANY LEADING ARCHITECTS.

SPECIALISTS IN GAS LIGHTING.

Private Gas Works erected in any part of the Kingdom.

THE
Architect and Contract Reporter.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

The Leeds Mercury says a statement was submitted at a meeting of the Leeds gas committee, showing that during the year 1894 there had been a profit on the gasworks of about 36,000%. When the accounts are made up for the Corporation financial year, which ended the 25th of last month, even a greater profit, it is expected, will be shown. The surplus will not only enable the committee to pay off a debt of 31,000%, but leave them with a small sum in hand. Remembering that by the abolition of gas-meter rents a source of income that amounted to something like 11,000% has been sacrificed, the news of this large profit will come as a pleasant surprise to many.

BUILDING AND BUILDERS.

At the Edinburgh Dean of Guild Court were eighteen applications for warrants for new buildings or alterations on existing structures. Eleven of these were granted. They included warrants to Mr. Robert Croall for the erection of office, store and carriage shed at Middlefield, to Mr. James Miller for a double villa at Hermitage Gardens, and to Mr. James Anderson for a tenement of houses at Bothwell Street.

At a meeting of carpenters and joiners at Manchester it was announced that the masters in the building trade had conceded an increase of a halfpenny an hour, and a reduction of hours from 52 to 49½ per week, the alterations to come into force on June 1. Several minor points were left for decision by a committee representing both sides, but the employers decline any concessions as to walking time, grinding time and the question of notice otherwise than in accordance with present rules.

At the annual meeting of the Whiston Rural District Council a sewage scheme for Whiston was considered, and the clerk was instructed to get estimates for the work, to cost about 2,000%.

At the meeting of the Glasgow Town Council plans for the erection of additional tenements on the balcony system, proposed to be erected in Mason Street and Collins Street, were approved, and tenders for the work ordered to be obtained.

THE construction of a new bridge over the river Dee, between Queensferry and the Cheshire side, which is to cost 13,000%, commenced on Monday. Mr. T. K. Irwin, of Hurnsworth-on-Tees, has been appointed clerk of the works. The contractors for the work are the Teeside Waggon and Engineering Company.

THE annual dinner of the Brighton master builders took place at the Hôtel Métropole, the mayor, Mr. W. Botting, presiding. The relations between the masters and the operatives seem from the report to have been mutually satisfactory, though agitators have apparently tried to create discordance.

MR. JAMES BIRTWISTLE, the architect for the municipal buildings at Preston (Victoria), being dissatisfied with the workmanship, material and delay of the contractor, and having been informed to that effect, has determined the contract. Mr. Birtwistle wrote to the building committee of the Shire Council notifying determination of contract and his reasons for so doing. The architect has since called for tenders for the Preston municipal buildings at the risk of the former contractor.

"SPHINX" PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1½ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving.

"ECLIPSE" PORTLAND CEMENT. Quick-setting; test, 8 parts. Standard Testing Sand, 280 lbs. per square inch; 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c. Samples sufficient for Practical Tests Free. Manufactured by JOHN BOARD & CO., Dunball, Bridgwater.

ESTABLISHED 1844.

SIRAPITE PLASTERING.—MILLER & SELMES, Plasterers, 76 Longstone Road, Eastbourne, having used over 2,000 tons of Sirapite with invariable success, are prepared to contract for plastering with this material in London and elsewhere at about same cost as common lime and hair.

ELECTRICAL.

THE acquisition by the Liverpool Corporation of the Electric Light Supply Company's undertaking for 400,000 $\frac{1}{2}$ has been practically determined upon by the special lighting committee, who have authorised a thorough examination of the property and the financial position of the company prior to entering into an agreement.

AT Worcester an official inquiry has been held respecting the application of the City Council for sanction to borrow 20,230 $\frac{1}{2}$, for purposes of electric lighting. It was stated that the Local Government Board had already sanctioned the applications of the Council to borrow some 41,000 $\frac{1}{2}$. The additional money was required for additional work and extras, which were explained by the city surveyor.

AT a meeting of the Society of Arts, Mr. R. E. Crompton, president of the Institution of Electrical Engineers, read a paper on "The Use of Electricity for Heating and Cooking," Mr. H. Preece occupying the chair.

THE cable for lighting Ayr with electricity is now well laid in Mill Street, High Street and Sandgate Street. Main Street, Newton, is yet to be done. Several of the principal merchants have arranged to take in the light.

SEVERAL influential gentlemen in Ayr and district have under consideration a proposal for the construction of an electric tramway from Prestwick and Ayr to Burns's Cottage and Monument.

TRADE NOTES.

THE streets and buildings committee of the Edinburgh Town Council have accepted the estimate of Mr. John Waddell, amounting to over 5,000 $\frac{1}{2}$, for the construction of the subway between Dalry and Fountainbridge.

TO avoid delay in the construction of the projected open-air baths in Burlington Street, Liverpool, the finance committee of the Corporation have authorised the baths committee to select the contractor and proceed with the work, subject to the approval of the Local Government Board and the City Council.

A NEW eight-day turret clock, showing the time upon four external dials painted and gilt, and striking the hours on a large bell, has been presented to the parish church, Benwell-on-Tyne, by Mr. Walter Scott, the necessary work having

been done by Messrs. Wm. Potts & Sons, clock manufacturers, of Leeds, and Collingwood Street, Newcastle-on-Tyne, from instructions from the architects, Messrs. Hicks & Charlwood, 42 Grainger Street, Newcastle-on-Tyne.

THE new extensions to the Wigan Infirmary are being warmed and ventilated by means of Shorland's patent double fronted Manchester stoves, with descending smoke flues and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE quarterly meeting of the London and Provincial Foremen's Association will be held to-morrow (Saturday) at the Memorial Hall, Farringdon Road, E.C., when the adjourned discussion on "Past and Present Apprenticeship" will be resumed.

AT the meeting of the Bath Pump Room committee, eleven tenders were received for the work of the Pump Room extension. The tenders ranged from 18,138 $\frac{1}{2}$ of Messrs. J. Long & Sons, Bath, to 26,190 $\frac{1}{2}$ of Messrs. Dounes, of London, and the former was accepted.

ACCORDING to *Bric-à-Brac* the latest addition to Palmer's Museum in the Strand is a great curiosity in stamps. The description as it appears in *Bric-à-Brac* is lengthy, and no justice could be done to it by an abstract.

VARIETIES.

A FIRE has taken place in Dundee at the works of Messrs. Grimonds, manufacturers. The damage is estimated at 10,000 $\frac{1}{2}$, which includes 7,000 $\frac{1}{2}$ for jute, the building and material being insured. The main buildings, owing to fireproof partitions, have been protected to a great extent.

AN inquiry has been held at the Salford Town Hall into an application by the Corporation for power to borrow further moneys not exceeding 100,000 $\frac{1}{2}$ for the purpose of their gas undertaking.

A REMARKABLE change has recently been effected in the appearance of the fine old parish church of St. Stephen's-by-Saltash, the vicar having taken in hand the much-needed restoration of the lofty tower and other parts of the structure. The work has been carried out by Mr. A. Carkeek, of Redruth, in accordance with specifications prepared by Mr. George Fellowes Prynne, architect.

ANTHYDOR COMPOUND & GENERAL PAINT CO.
LIMITED,

47 VICTORIA STREET, WESTMINSTER, S.W.

A MEETING has been held in Bradford to discuss the advisability of establishing a Yorkshire Society of Painters in Water-Colours, not in opposition to the present Union of Yorkshire Artists, for it is considered that the taste for water-colour paintings will be better cultivated by a society which exists for that alone rather than one which, as does the Union, concerns itself with both oil and water-colours.

At the meeting of the East of Scotland Engineering Association, Mr. Wm. Simpkins, C.E., president, in the chair, a paper on "Road Subventions" was read by Mr. J. Robb, assistant county road surveyor. After giving a sketch of the system of road maintenance and administration in Scotland prior to the adoption of the Roads and Bridges Act, 1878, the question of subvention as affecting the city of Edinburgh and the county of Mid-Lothian was discussed in detail. It was stated that the increase of traffic on county roads had far exceeded what was anticipated on the abolition of tolls, more especially in the case of pleasure-driving from towns, and it was contended that the application of the principle of tolls, whereby the user of the road should pay for its upkeep, was the simplest way of determining the use made by burgh communities of the roads in the neighbourhood.

At the quarterly meeting of the Birmingham Tame and Rea District Drainage Board, the estimates of income and expenditure for the year commencing March 26 last were adopted. The total amount required was 34,448*l.*, an increase of 40*7*/₁₀₀ on the preceding year. Resolutions were adopted for the purchase of two plots of land in the Tame Valley in order to enlarge the Saltley Sewage Farm, the total cost being 1,075*l.*

It is stated that Lord Penrhyn has decided to remove Talcen Mawr, a huge rocky pinnacle in the centre of his slate quarry, owing to the action of the weather having rendered it unsafe. The rock is being undermined, and in the chambers will be placed seven tons of gunpowder, which Mr. Young, the manager, estimates will displace 125,000 tons of rock. The fuse will be fired at three o'clock to-morrow (Saturday), and it is announced that the public will be admitted free to witness the explosion, subject to regulations to be enforced to insure safety.

THE Urban District Council of Finedon are projecting the complete sewerage and supply of water for the town of Finedon, and at their April monthly meeting instructed Messrs. Mosley & Anderson, of Northampton, to prepare schemes for both to lay before the Council as early as possible.

THE Vienna correspondent of the *Standard*, referring to earthquake shocks at Laibach, says that the official commission appointed to inquire into the damage to the buildings reports that 10 per cent. of the houses will have to be pulled down, that 80 per cent. stand in need of material repairs, and that the remainder are slightly injured—in short, the whole of the town has to be virtually rebuilt.

HER MAJESTY'S Secretary of State for Foreign Affairs has received from Her Majesty's Minister at Mexico a copy of the prospectus of the exhibition of Industries and Fine Arts to be opened in the city of Mexico on April 2, 1896, at which there will be a foreign department, and special Customs exemptions and other facilities are promised to foreign exhibitors. This prospectus may be seen on application to the Commercial Department of the Foreign Department, between the hours of 11 and 6.

AT the annual general meeting of the West of Scotland Iron and Steel Institute, Glasgow, Mr. James Riley, president, in the chair, the report by the Council showed that forty-one members had been admitted during the session, and after allowing for removals from various causes there was a net gain in membership of thirty-one, the total on the roll being 187 members.

AN inquiry has been held at Marple Bridge into the application of the Glossop Dale (Derbyshire) Rural District Council for sanction to borrow 6,000*l.* for works of sewerage and sewage disposal in the township of Ludworth, and also for the approval of the Local Government Board of the formation of a special drainage district in the township.

NEW ROOM AT THE CAFE VERREY.

THE opening on Saturday last at the Café Verrey, Regent Street, of a new room was quite an important function, which was attended by a large gathering of social, literary and artistic celebrities, whose unanimous approval was expressed in the warmest terms, and Messrs. J. & G. Krehl are to be congratulated upon the happy results of their efforts to attain the acme of elegance and comfort. The style adopted for this *ultra chic* resort for lunchers and diners-out is Persian, and combines oriental richness of detail with the Grecian grace of pure architectural form.

The walls (to the height of two-thirds) are treated with a system of octagonal columns springing from the floor, and

WINSOR & NEWTON'S "Waterproof" INDIAN INK.

This new preparation—made from genuine Indian Ink—has been introduced to meet the requirements of those Artists, Architects and Designers who wish to lay washes of colour over drawings in ink.

Unlike many so-called Indelible Inks, "Waterproof Indian Ink," when dry, will be found absolutely unaffected by subsequent wetting.

supporting the main cornice around the room; another intermediate system of smaller circular columns springing from a surbase, support arches, shaped and enriched, which form a pelmet frieze under the main cornice. The constructive portions are finished in old ivory polished lac, the surbase has mottled red translucent glass tiles; the wall space between the surbase and cornice is covered between the columns with velvet, having upon a deep blue ground a foliated pattern in pale turquoise green and old gold colours, affording a soft and most pleasant field of repose to the eye. The central spaces on each wall are fitted with silvered plate-glass and the main cornice has a frieze of deep blue translucent glass tiles recalling the ground colour of the velvet below. The remaining one-third of the wall space above the cornice is occupied by intersecting vaulted arches which spring from the caps of the octagonal columns, and extend forward in a double arched line to support the frame of the central square skylight; these intersecting vaults are finished with beaten metal leaf as oxydised silver, with pale turquoise green and deep blue backgrounds, which display the "all over" design of the relief work. The arched wall spaces between the vaults are all fitted with silvered plate-glass, which produces the pleasing illusion of an open space around the room above the cornice. The enriched ceiling of the central skylight with its side windows, perforated arches and enriched framing is also finished as oxydised silver.

The floor is covered with a deep ruby-red oriental carpet, harmonising exactly in colour with the glass tiles of the surbase. The chairs and tables are of old mahogany, and seats of bluish-green morocco leather. The electric lighting is all sky light, and is arranged in three ascending series, the lowest in the form of pearls within polished lac-white shells with tinted and gilt edges, fixed upon the deep blue glass tiles of the main cornice. The second series are oriental lamps dependent from the three projections of the double vaulting arches, and the third series are in the form of silvered and glass stars around the frame of the central skylight. The designs were prepared by and the work executed under the direction of Mr. Geo. Brown, of Newman Street, W.

A FIRE took place at the Oxford County Lunatic Asylum, at Littlemore. The flames were discovered in the Women's quarters, and the patients, numbering upwards of 300, were immediately conveyed to a place of safety. It was found impossible to save the south wing of the asylum. The damage is estimated at several thousand pounds.

POLYTECHNICS IN LONDON.

In the report of the Charity Commission, the following paragraphs summarise the effects, direct and indirect, of the City of London Parochial Charities Act of 1883 as administered and carried into effect by the Commissioners:—

We proceed to state, in continuation of the information given in our last report, the progress made in the establishment of so many of the nine institutes proposed to be founded by schemes made under the City of London Parochial Charities Act, 1883, as were not completed at the beginning of the past year. Of these nine institutes four are already completed, viz. the Borough Road Polytechnic and the Battersea Polytechnic, opened in January 1894; and the Bishopsgate Institute and the St. Bride's Institute, opened in November 1894. The five remaining institutions are in various stages of progress.

The Cripplegate Institute.—The conveyance of the site of this institute has now been completed, plans of the proposed buildings have been approved by us, and the governors have been authorised to accept a tender for the execution of the work at a cost of 22,801*l.*

The Northampton Institute.—The erection of the institute is proceeding, and a sum of 19,700*l.* has been expended out of a total authorised cost of 34,207*l.*

The South-Western Polytechnic Institute.—The governors have been authorised to accept a tender for the completion of a second section of the building, in accordance with approved plans, at a cost of 9,490*l.*, which, with the cost of the first section previously authorised and now in progress, will make a total expenditure on building of 24,014*l.*

The North-Western Polytechnic Institute.—We have conferred with the governors upon the obligation imposed on them of making some progress towards the establishment of this institute, and it is understood that efforts are being made to secure the freehold of the proposed site.

The Northern Polytechnic Institute.—Plans of the proposed buildings have now been approved by us and the governors have been authorised to accept a tender for the execution of the first two sections of the work at a cost of 15,531*l.* The Clothworkers' Company have arranged for the commutation of an annual grant, promised by them to the institute for thirty years, into a donation of 10,000*l.*, which, with the sum of 7,500*l.* previously contributed by or through the instrumentality of the company, makes a total contribution by them of 17,500*l.*

NEW CATALOGUES.

THE Electrical Power Storage Company, Limited, of 4 Great Winchester Street, are issuing a new illustrated price list, and one in a most convenient form for reference. By a novel arrangement there is no need to search through a table of contents to find a special page. On opening the catalogue at the first page, that which is dealt with on every subsequent page is seen at a glance, and by putting a finger down, the page wanted is immediately opened. The "E. P. S." batteries, cells, &c., are well known, but there are several novelties and improved apparatus now shown in this catalogue. There is also noticeable a considerable reduction in the price of cells, while at the same time there are those of larger size. Also the "Q" type, a cell which they have lately put on the market, and which, owing to its small bulk and weight, is useful for portable purposes. The cell-inspection lamp is a novelty, and is sufficiently thin to go between the plates of the cells, and consequently enables a thorough inspection to be made without removing the plates from the acid. Of the regulating switches a new type is also brought before the trade; it is circular, and consequently very compact, and by utilising the double-circuit switch, as shown, one base is made to do for both charging and discharging circuits. This company has now had fourteen years' experience in the manufacture of storage batteries, and by improvements in design and manufacture, the result of lengthy experiments, they have now been enabled to produce batteries, such as the central station type, which will give 1 kilowatt output for five hours, at list price of about 32%. This, it will be seen, is a considerable reduction

on the prices of a few years ago, when for such an output the cost would have been nearly 50%. The catalogue has a fund of information that we cannot too highly recommend our readers to consult.

WOLVERHAMPTON IRON.

THE new quarter has opened rather more hopefully, as inquiries are brisker and the tone is stronger. Manufacturers announced that the old quarter has resulted in a larger out-turn than was anticipated from the business which was done a month or six weeks ago. Better time is being made at the works on the clearance of orders, but there is a reserve of business that will require attention during the month. The demand is favourably influenced by reason of the larger quantity of material which is desired by district consumers, though these people confine their custom to immediate wants, and they are not disposed to place forward orders. A strong tone characterises the home trade, and some satisfactory indents are furnished by export merchants for several classes of iron made in this district. At present, however, there is no indication of a permanent growth of demand, nor are buyers inclined to place orders even at the present low selling prices for more than will cover their early supplies. The orders being given out are chiefly for bars, sheets, hoops, angles and strip. Various small sizes of iron are also finding rather more custom for immediate delivery; and for steel orders are furnished more regularly than they were several weeks back, mainly for bars, plates, billets and blooms. Stamping-sheet makers are doing a steadier business, and quote former figures. Contracts for pig-iron are withheld, and makers are not looking for much new business, and are putting iron into stock rather than sell at less money; and unless there is more metal wanted several furnaces will be damped out. Current quotations, both for crude and finished iron, show scarcely any alteration.

THE death is announced of Mr. George Daglish, an old and well-known builder, a native of Morpeth. Mr. Daglish was concerned in the erection of many important buildings, and for several years was a member of the Town Council.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

At the ordinary meeting of this society on Wednesday, April 10, a paper was read on "Laundry Machinery" by Mr. H. Coward, in which he dealt with various forms of washing, wringing and ironing machines, with the drying of linen and the various principles involved in carrying out, in a thorough and satisfactory manner, the proper cleansing of wearing apparel and other articles which are included in the general term of "household linen." A special point of interest in the paper was that of a process of boiling flannel without hardening or prejudicially affecting it, this being done without the use of any chemicals or additions to the water other than those usually employed. Diagrams and models in illustration of the subject were exhibited, and a long discussion ensued in which the president, Mr. C. T. Walrond, A.M.I.C.E., the honorary secretary, Mr. E. H. G. Brewster, A.M.I.C.E., M.I.M.E., &c., Mr. E. Taylor, Mr. A. W. Ackermann, A.M.I.C.E., Mr. R. E. Phillips, A.M.I.C.E., and many others took part.

PLUMBING EXAMINATION.

THE following questions were set for the students of the Sanitary Engineering Section of the Sydney Technical College:—

1. Classify the different sources of water-supply under the following heads:—(a) Wholesome. (b) Suspicious. (c) Dangerous.
2. State the poisonous metals commonly to be looked for in water. Describe their influence upon health, and simple tests for detecting same. Mention the kind of water and the constituents likely to act on lead pipes and cisterns and the special action of hot water and steam in this respect. What are the constituents in water which prevent injurious action in lead vessels or piping?
3. What is the approximate quantity of water required per head for a public water-supply, distinguishing between domestic, manufacturing and public purposes? Give some examples.
4. What are the advantages or disadvantages of constant *v.* intermittent water-supply with regard to usage, pollution and waste?
5. Give a description of the arrangement and purpose of a Deacon's waste-water meter.
6. State the objects of the following fittings:—(a) Loose

valve-cock; (b) waste-not valve; (c) a waste-not system. Describe arrangement and working of any good type of same. Mention any other details of house-plumbing fittings you would consider necessary for the prevention of waste and pollution of a public water-supply.

7. What is the purpose of a storage balance reservoir and service reservoir? Give examples of each.

8. What are the general proportions of an earthen dam—describe the puddle wall and object of same? What is the object of a bywash, and where would you fix it in connection with an earthen dam as compared with a masonry dam? What considerations would guide you in fixing the dimensions of the bywash?

9. In an earthwork dam, in what position would you fix the outlet tunnel? Give a sketch showing same with inlet tower.

10. What is the object of covering in clear water or filtered water storage tanks or reservoirs?

11. What is the difference between an inferential and an absolute measure water meter, and give a short description of a good type of each?

12. In arranging the reticulation pipes for a water supply, how would you proceed? Describe the function and working of a reflux valve, air valve. What is the maximum velocity desirable in water mains?

13. If it is absolutely necessary to rise above the hydraulic grade in a line of pipes, to what height above would you deem it safe to rise, and what special provision must then be made?

14. What is the meaning of "duty" and of efficiency in a pumping plant? What is fair duty to reckon on in ordinary good type of pumps? What is "slip," and how can it be minimised or avoided?

15. Describe shortly the difference between a bucket, a plunger, and a bucket and plunger, a piston and a centrifugal pump. What is a rotary type as compared with a direct-acting pump? What is the object and action of the high-duty attachment in a Worthington pump of the internal plunger type?

16. What is the law governing the bursting of pipes under internal pressure, and how does the strength of a pipe vary in terms of pressure, of thickness of metal, and of diameter?

17. In a sewerage system what is the meaning of "the combined," "partially separate," and separate systems? Give your ideas of the advantages or disadvantage of each.

18. Give a sketch of a manhole and lamphole, also gully, stating purpose and best form of each. Show how a branch sewer can be connected to one at much lower level.

WOOD BROKERS,

108 BISHOPSGATE STREET WITHIN, E.C.

19. Describe shortly the difference between "chemical treatment," broad irrigation, and intermittent filtration in sewerage treatment, and how are the methods sometimes combined?

20. Describe shortly the principles of the International process for water and for sewage purification.

21. A district has to be provided with storm-water sewers; the area to be provided is 600 acres, which can be divided into three zones—low level, 300 acres; mid level, 200 acres; high level, 100 acres. The available grades are—1 in 500, 1 in 250, and 1 in 100 respectively. The rainfall to be provided for is $\frac{1}{2}$ inch per hour running off in the time it falls. Calculate diameter of circular drain in each case. Formula to be used:—

$$D = 1.5\text{th root of } \frac{Q^2 L}{1542 H}$$

Where Q = cubic feet per second.

L = length of sewer.

H = height = 1 foot.

D = diameter in feet.

Give cross-section of drain to be made in concrete in bad ground.

22. Describe shortly the principles on which garbage destructors should be constructed, giving general details of the best types.

23. What is the object of flushing drains and sewers, and describe the circumstances under which flushing is necessary and how it is accomplished; giving particulars of the main types of apparatus employed, including some of the leading types of automatic flushing tanks.

24. Describe shortly the principles on which the pneumatic systems work—for example, the Lieurner and Shone system. In what cases (if any) are these systems suitable?

THE NORTH SEA AND BALTIC CANAL.

It is anticipated that in June the new ship canal between the North Sea and the Baltic will be opened. A waterway of the kind has been often proposed, but it is only eight years since the works were commenced. The canal will cost about 7,800,000*l.*, Prussia contributing a third of the amount.

A full description of the new waterway will be found, says the *Times*, in Herr C. Beske's book, "Der Nord-Ost-See Kanal," but we have space here for only some of the leading points. The canal is a little over 61 miles in length and is

throughout on the same level as the Baltic, where tides are unknown. Hence only two sets of locks have been necessary, one at each end, and even of these two the Holtenau locks may be treated almost as non-existent, as their gates will have to be closed only on the occasion of storms on the Baltic affecting the height of the waters there—say on twenty or twenty-five days in the year. Thus for vessels proceeding westward there will be an absolutely clear and unobstructed course as far as Brunsbüttel, and here, except for three hours each day at ebb tide, the lock-gates will have to be kept closed on account of the tidal changes in the Elbe, though vessels will be able to pass through at any time, subject to the ordinary delays. The breadth of the canal at the water level is 197 feet and at the bottom 72 feet $1\frac{1}{2}$ inches, thus allowing of a man-of-war and any ordinary merchantman passing one another wherever they may happen to meet, while at six different points along the line of route there are "bays," where the increase of superficial breadth from bank to bank to 328 feet and of the bottom breadth to 197 feet for a distance of 820 feet will allow of the passing of two men-of-war without fear of collision. The depth of the canal is 29 feet 6 inches. The old Eider canal, which has been incorporated in the new one as far as Rendsburg, save for various windings, now happily avoided, had besides its six sets of locks a depth of only 10 feet and a breadth of a little over 100 feet. The superiority of the new canal, with its far greater dimensions, almost unobstructed course and its outlet into the Elbe at a point where the river has a depth of about 40 feet, is clearly manifest.

As regards the work of construction, the most interesting feature is perhaps to be found in the great terminal locks, and of these the locks at Brunsbüttel claim first consideration. They are protected from the current of the river by two moles, the heads of which are 1,247 feet apart, thus allowing a good space for entrance into the outer harbour, which has a breadth of 328 feet and a length of 1,312 feet. Here the vessels that may have to wait their turn before passing through the river will be accommodated. The locks themselves are double, the one set lying parallel with the other, divided by some massive masonry, under which are several tunnels for the hydraulic machinery to be used for opening or closing the gates and other purposes. The width of each lock is 82 feet, the depth 30 feet and the available length, when the gates are closed at each end, is 492 feet—dimensions adequate to allow of the passing through the locks at any state of the tide of the largest ironclads now

OFFICE: 175 STRAND, LONDON, W.C.

possessed by Germany, while vessels the length of which exceeds that of the locks will still be able to pass through them during those hours of the day when the gates are all open. It is estimated, however, that four steamers or nine sailing ships of ordinary measurements can find room in each set of locks at one time, so that the period of detention ought not to be very great. As, too, the canal will be lighted with electricity along the whole of its length, vessels will be able to pass through by night as well as by day. On leaving the locks a ship coming from the Elbe will enter the inner harbour, which has a length of 1,640 feet and a breadth of 656 feet. Here the vessels from the Baltic will await their turn to enter the locks, and here, too, there will be a coaling station, accommodation for men-of-war, and a small harbour on the northern side for vessels used in connection with the working and maintenance of the canal. Outside the inner harbour the waterway tapers off to its normal dimensions.

The locks at Holtenau are similar to those at Brunsbüttel, though the outer and inner harbours vary in their dimensions, and the work generally has not presented so many difficulties as that done at the other end. It was carried on mainly in the dry, and the tidal fluctuations of a powerful stream like the Elbe had not to be provided against. Thus the cost of the Brunsbüttel harbour and locks is put down at 771,750*l.*, as against 660,000*l.* for those at Holtenau.

The bridges have formed another specially interesting feature of the work, from an engineering point of view. The canal is crossed by four lines of railway, and for two of these, the Neumünster-Heide line at Grünthal and the Kiel-Eckernförde line at Levensau, near to Kiel, fixed bridges have, with the help of embankments, been constructed at such a height above the level of the water that full-masted vessels can pass underneath without obstruction or delay and with only the lowering of the royal mast, the clear space between canal and bridge being 137 feet 9 $\frac{3}{4}$ inches. These two bridges have the widest span of any in Germany, the arch being 511 feet in length. The Levensau Bridge was formally opened by the Emperor on December 2, 1894. The two other railways, the Neumünster-Rendsburg line at Rendsburg, and the Itzehoe-Heide line, near to Brunsbüttel, are carried across the canal by means of swing bridges, the pivots of which are on the embankment of the canal, while each line has two separate bridges, carrying a single set of rails, so that in case of the one bridge becoming unworkable for a time the traffic could still be carried on by means of the other. There

is, too, at Rendsburg still a third swing bridge for the purposes of ordinary traffic. These bridges are said to be the largest of their kind yet constructed, their length being 328 feet, while they stretch across a clear breadth of 164 feet of water. Yet, notwithstanding their massive proportions, they can be turned completely round, by means of hydraulic power, so as to leave a clear course for high-masted vessels within so short a space of time as two minutes. The railway swing bridges will be in position only when trains are expected, remaining at other times parallel with the canal, though the bridge for pedestrians and vehicles will remain in position, being drawn aside only when necessary for the passing of vessels along the canal.

To the north of Rendsburg the railway crosses still another bridge at a point close to where locks have been provided for the purpose of maintaining communication between the North Sea Baltic Canal and the Eider river. Just to the east of Rendsburg there is a succession of small lakes, formed by the Upper Eider, and constituting part of the old Eider Canal. The new canal is diverted to the south-west at the Audorfer Lake, and passes to the south of Rendsburg, under the series of three bridges already spoken of; but the old waterway for the short distance from the lakes to the Lower Eider is to be maintained as well, in the interests of vessels proceeding to the river from this point, instead of continuing along the ship canal. In this way any interference whatever with the old Eider Canal traffic will be avoided, and vessels will be able to proceed along the river Eider to Tönning as before. But these arrangements rendered necessary a series of important works on the north side of Rendsburg. In the first place, the water level of the Upper Eider and hence of the lakes referred to had to be reduced to the same level as that of the ship canal, which was here to be incorporated with it, and the effect of this was to so far prejudice the interests of millers and others living in the neighbourhood that substantial compensation had to be paid to them. The reduction of the water level made still more necessary than before the deepening of the channel leading from the lakes to the Lower Eider, and this involved the building of a new railway bridge, which here also is a "swing" one, though in this instance the bridge rests on a central pivot built in the middle of the stream and not on one of the banks, the vessels passing on either side. New locks, much more commodious than those previously existing at Rendsburg, have also been provided to facilitate the passing from the different levels of river and canal, so that altogether the work carried out at Rendsburg has assumed a character of considerable importance.

SPRINKLER, Closed.

HARDYS' PATENT

No. 15,811.

For Prices and further Particulars apply to the
SOLE PATENTEES—

MESSRS. H. & J. HARDY,

**ALBANY WORKSHOPS,
SWANAGE, DORSETSHIRE.**

No. 2.—AUTOMATIC SELF-LOCKING ACTION.

No. 3.—THE SELF-HELP FASTENER.

A large number already in present use giving full satisfaction. Unrivalled.

COMBINED STAYS AND FASTENERS FOR CASEMENTS AND FANLIGHTS.

WE beg to call your special attention to our Patent Combined Stay and Fastener, which, from its great advantages and easy mode of use, can well claim a superiority over the common kinds. You will notice that this Fastener has no complex system of working, is easy to fix, and, whether the casement is open or shut, does not project into the room, but hangs down the centre of the sash free from curtain or blind. The advantage of this Patent Fastener is that, being fixed in the centre of the sash, it affords protection against sudden gusts of wind when open, and keeps the sash safely closed when shut, as it acts as a fastener for the casement as well as a stay. Each of the three kinds of Fasteners affords the same advantages in all respects, as, though varying in shape, size, and price, are only different ideas of the same method. These Casement Fasteners can be used both for wood or iron, for single or double casements. The special pattern is used for fanlights to open outwards, and all can be used both for right or left hand. We can supply these Fasteners in any number of links, according to the extent the casement is required to be opened. We may also note that the Fasteners are well made and finished, can be had both in brass and iron, and are, therefore, well suited for any kind of residence. Quotations and further information will be given on application. Also testimonials. Please state in ordering whether you require them for single or for double casements.

Stay and Fastener shown in Action.

Cases for Binding the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

A further interesting feature in the cutting of the canal was that connected with the Flemhuder Lake, a stretch of water some 578 acres in extent, and forming another of the series of lakes through which the Upper Eider passes before reaching Rendsburg. The level of this lake was 23 feet higher than that of the new canal, and to have so extensive a collection of water as this, and one, too, nearly 100 feet deep in parts, quite close to the new canal—into which the Eider, flowing from the lake, would still have to find an outlet—was, of course, altogether undesirable. Hence the water of the lake was made to run off into the canal until equality was established between the two, an opening then being cut in the canal banks wide enough to allow of a vessel passing direct from the canal to any part of the lake. The immediate result of this partial drainage of the lake was that large tracts of land were laid dry, though in order not to interfere unduly with the water supply of the locality a ring canal was made, by means of dams, around what were formerly the extreme limits of the lake, and hence on the same level. The Eider itself still flows into the Flemhuder Lake on the south side, but it now has a fall of 23 feet, and it is of some importance in the efficient working of the canal, as its waters will help to maintain a steady current from east to west, decreasing the possibility of the canal's being frozen over in winter, and increasing the volume of water which, flowing straight through the Brunsbüttel locks at ebb tide, is to help in keeping the North Sea entrance clear of obstruction.

The only other special feature of the engineering work which need be mentioned here was the trouble involved in cutting through some particularly marshy land around the Kuden Lake near to Brunsbüttel and the Meckels Lake, to the west of Rendsburg. Here light bridges were first built, little by little, in parallel lines across the bog, and along them were pushed small waggons containing sand, which was thrown down on the bog in such a way that the supports of the bridge were gradually covered by it. Then larger waggons of sand were sent along, and so in course of time a solid mass was obtained, the sand either pressing into the bog by its own weight or being worked in by the men employed. In this way a firm double dam was eventually formed capable of resisting both the pressure of the canal water on the one side and of possible inundations on the other. Then the intervening space between the parallel dams was dug out to the required depth, and a firm foundation for the canal, with its sides of stone and cement, eventually secured. With the exception of these stretches of

bog land the course of the canal mostly passes through sandy or clayey soil, and though no blasting operations were necessary, a good deal of the sand was of so loose a character that much trouble resulted at times from landslips, and special precautions were necessary for strengthening the sides of the canal in those parts where the soil is of this description. Steady perseverance, however, has enabled the contractors—working under the superintendence of the Imperial North Sea Baltic Commission—to overcome their difficulties, and the way in which the whole project has been carried through in accordance with the original programme, and, on the whole, within the original estimate of the cost, reflects the highest credit alike on those who mapped out the plan of operations and on those who have had the responsibility of carrying it into effect.

THE Automatic Turnery Patents Company, whose prospectus will be found in our advertisement columns, invite public subscription, capital 75,000*l.* in 1*l.* shares. The object of the company is to acquire all rights of every description in the inventions of Messrs. Burke Brothers, of Scranton, Pa., U.S.A., for a wood-turning machine. Of this machine, which can be seen daily in operation at 40 and 41 Kirby Street, Hatton Garden, we were able to make very favourable mention in our issue of November 23 last. It is simple in construction, consisting of a changeable set of revolving cutters and a movable frame to carry the wood travelling backwards and forward over them, and is capable of turning in a single operation, and completing, newel posts, porch columns, balusters, chair and table legs, billiard-table legs, columns and pilasters for cabinet work, &c. These can, with equal facility, be produced round, square, octagonal, hexagonal, or pentagonal, or say, one-half round and one-half square, concave or convex, in any design or style, and leaving the machine quite finished, thus dispensing with sand-papering or any hand work whatever. A striking feature of the machine is the speed with which it operates; no less than eighty square baluster rails can, for instance, be produced in an hour. Hard woods, such as oak, box or ebony, are as easily manipulated as those of the softest grain, and in fact give, if possible, a better result, as the details work up sharper. The machine is practically automatic, and having very few parts costs very little for maintenance, therefore the work, despite its excellence, can be produced at a very low price.

Manufacturers of Wrought Metal Work, Architectural Carving and Joinery for Ecclesiastical Purposes, Domestic and Public Buildings, Lighting Appliances, &c.

Estimates given to Architects' own designs. Work can be inspected during execution.

Showrooms:—79 Edmund Street BIRMINGHAM; 48 Great Russell Street, LONDON, W.C.; Concert Street, Bold Street, LIVERPOOL.

WORKS:—Eagle Works, Hornsey, N.; Porchester Street, Birmingham.

THE SOUTHAMPTON STEAM JOINERY CO., BELVEDERE WORKS, SOUTHAMPTON.

London Office: 11 Clement's Inn, Strand, W.C. Estimates supplied.

Manufacturers of JOINERY suitable for all purposes, from the Cottage to the highest class of Mansion and Public Building.

IN HARD OR SOFT WOODS.

Church, Bank, Office, Shop, Ship, Yacht and other Fittings. School Seats and Desks. Chimney-pieces. Horticultural Buildings, &c.

MOULDINGS. ELECTRIC LIGHT CABLE CASINGS AND COVERS.

STEAM SAWING, PLANING, AND MOULDING MILLS.

Joinery and Fittings have been manufactured at these Works (which are the largest in the South of England) for some of the most important buildings in this Country and Abroad.

Shorland's Inlet and Outlet Ventilators in every Design.

THE VENTILATION OF BUILDINGS.*

IN presenting briefly a few suggestions and fundamental principles which it is believed may be found of service in arranging the ventilating system of public and private buildings, the sole effort has been to embody in as brief and lucid a form as possible the information which the writer has gathered during some years of study of the subject, and such facts as he has gleaned from his own experience in planning and superintending buildings of some size for hospitals and other purposes. The only recommendation offered for the plans and principles suggested is that they have borne the test of practical experiment in a satisfactory manner, which cannot be said respecting all the schemes for the warming and ventilation of buildings which have been offered in works on sanitary subjects published within the last score of years. In justice to himself the writer ought to say that he has not undertaken to make this paper exhaustive or anything more than what its title indicates; neither has he undertaken to enter the field which properly belongs to the architect, but rather to present simply such suggestions and theories as he has himself found of practical value and which are susceptible of general application, omitting altogether the minor details, which however necessary to the adaptation of a general plan or principles to any particular case, are likely to be of very little service except in the special conditions to which they are specially adapted. Seeking then to avoid as much as possible redundancy of language and circumlocution in methods of presentation, let us begin at once the discussion of the things most essential in a correct scheme for the proper ventilation and heating of a building.

First of all it may be stated that the ventilation and heating of a building must be considered together, for a successful working of each will depend upon the conditions of the other. It needs no argument to impress the fact that the amount of heat to be furnished in any given instance must depend very largely upon the amount of fresh air to be supplied per hour or minute. If the air of a room is to be changed four times per hour, certainly a proportionately larger quantity of fuel must be consumed than if the air is to be changed but once an hour.

The air-supply of a room or building is generally determined

by its size rather than by the number of persons by whom it is to be occupied. This is certainly not a scientific method. A large room, occupied by but one or two persons, might possibly admit through cracks about windows and doors and through its porous walls a sufficient air-supply; while a small room, crowded with people, would require a very large provision for the supply of fresh air. The first thing, then, to be considered in the study of the ventilation of a room or building is the number of persons who are to occupy the space under consideration.

According to the most eminent sanitary authorities of England, each healthy adult person requires not less than 3,000 cubic feet of air per hour. This statement is based upon careful experiments, which showed that if the normal quantity of carbon di-oxide contained in the atmosphere—which is two parts to every 5,000 parts of air—is increased to three parts in 5,000 of air, the limit of tolerable impurity is reached; that is, if the amount of CO_2 is increased by respiration to a larger proportion than that stated, namely, three parts in 5,000, the air thus contaminated becomes productive of disease. It must not be supposed that the poisonous properties of such air are due to the chemical compound CO_2 . Air may contain a much larger proportion of CO_2 , provided this compound is derived from purely chemical sources, without injury being apparent. But when the CO_2 is furnished by the respiration of animals, there is associated with it a subtle poison which has been shown by the eminent physiologist, Professor Brown-Séquard, to be one of the most powerful poisons known, exceedingly minute quantities being sufficient to produce death.

A little computation based upon the experiments referred to will show that Dr. Parkes's figures are certainly not extravagant. With each breath each human being exhales into the air 1 cubic inch of carbon di-oxide and a definite amount of organic poison associated with it. As air naturally contains 2 cubic inches of carbon di-oxide in every 5,000 cubic inches of air, and as an additional cubic inch of CO_2 , or 3 cubic inches in 5,000 cubic inches of air is the limit of safety, it is evident that each breath renders unfit for further use 5,000 cubic inches, or approximately 3 cubic feet of air. The average person breathes eighteen times per minute; consequently each person spoils or renders unfit for further use 3 feet by 18 feet, or 54 cubic feet of air per minute. Fifty-four by 60 feet gives us, as the amount of air which each person contaminates per hour, 3,240 cubic feet, a slight excess over the amount named by Professor Parkes. Some other

authorities place the line of dangerous contamination at a somewhat higher point, and consequently they require a smaller amount of air. Avoiding either extreme, we may place the amount of air required per hour for each healthy person at about 2,400 cubic feet. It must be understood, however, that this rule applies to healthy persons only, and is not applicable to hospitals or buildings occupied by infirm or sick persons. For such institutions, and for manufacturing establishments in which the air may be contaminated by chemical or other processes, at least double the amount named, or 5,000 cubic feet of air per hour, must be supplied. In any given case, then, to ascertain the amount of air required per hour, we have only to multiply 2,400 or 5,000, as the case may be, by the number of persons to be supplied with air. The number of persons taken should be the maximum rather than the minimum number which the room or building is calculated to accommodate, for the evident reason that the capacity of a ventilating shaft, duct or opening may be easily diminished but cannot be so readily increased.

Having determined the amount of air required in any given case, the following important practical points remain to be determined:—

1. The circulation of the fresh air.
2. The area of fresh-air inlets.
3. The area of foul-air outlets.
4. The location of foul-air outlets.
5. The construction and location of foul-air ducts.
6. The location, sectional area and height of ventilating shafts.
7. The question of artificially assisting the draught by means of a pressure or suction fan, or by means of heat in the ventilating shaft.

We will consider each of these several questions in the order named.

1. A room cannot be properly ventilated without an efficient arrangement for the circulation of air. For this there must be for each space to be ventilated at least two openings: one for the admission of fresh air, the other for the removal of impure air. Nothing could be more absurd than the frequently witnessed attempt to ventilate a room by supplying it with a ventilating shaft connected with proper ducts and foul-air openings, but without any provision for a supply of fresh air. Such an arrangement is eminently well calculated to produce dangerous draughts through the opening of windows, and the impression that any attempt at efficient ventilation is liable to result in

failure. It is also essential for the proper distribution of the air admitted to a room that the air shall be heated before it enters the room or building, or at the moment of entering.

2. To determine the required area of fresh-air inlets, the amount of air required and the velocity at which the air is to travel must be known. Air heated to a temperature of 40 deg. Fahr. above that of the external air will travel at the rate of about 5 feet a second when entering a room of ordinary height from which it may escape readily. If the escape of air from the room is assisted by means of an efficient ventilating shaft the velocity of the incoming air may be safely computed as 10 feet per second. If the fresh air enters the room at a temperature so high as 120 deg. Fahr. to 150 deg. Fahr., the velocity of the air-current will be increased to 12 or 15 feet per second. Better practical results are obtained by large volumes of moderately heated air travelling at a moderate speed than from superheated air travelling at a high velocity.

Calculating the velocity of the incoming air at 10 feet per second, it is only necessary to divide the total amount of air required per second by ten, and the result will represent the area of free opening required. An allowance of at least 40 per cent. must be made when the openings are covered by register-plates. For example, suppose the amount of air needed is 240,000 cubic feet per hour, sufficient to supply 100 persons with the minimum quantity of air. This requires 66⅔ cubic feet of air per second. Sixty-six and two-thirds divided by 10 is 6.6⅔. Adding 40 per cent. for obstruction of register-plate gives us 9.3 square feet as the combined areas of the register-covered openings for admitting fresh air.

3. The number and location of the fresh-air inlets is not a matter of so great importance as is commonly supposed. If the fresh air enters the room at a temperature 20 deg. to 40 deg. higher than that of the air of the room it will go at once to the ceiling, no matter where or how admitted, and will thence gradually diffuse itself through the room, its course being chiefly determined by the location of the windows and of the foul air exit openings. I think it preferable that the fresh-air inlet should be in the wall near the floor, rather than in the floor, as it is by this means better protected against the accumulation of dust and dirt.

In the case of large buildings containing several floors and many rooms or apartments to be supplied with air it is best not to undertake to carry a separate fresh-air duct to each room, but to equalise the air-pressure within the building by leading large ducts to the common hall or corridor of

STOURBRIDGE.

The only Attwood in the Trade.

each floor, supplying each room of each floor through open transoms or register plates placed near the ceiling. This arrangement secures a constant supply of pure air in the halls or corridors from which each room can draw, and establishes a constant current in the direction of individual users of the air, the foul air being directly removed from each separate room by its own duct. This plan secures the greatest possible safety from the dissemination of contagion or the dispersal of any element capable of producing dangerous contamination of the air.

4. Experience has shown that in order to prevent unpleasant draught, the velocity of the air at outlet openings should not be greater than 5 feet per second. The necessary area of outlet openings is readily obtained, then, by simply dividing the total amount of air to be supplied per second by 5. For example, suppose a room to be ventilated is calculated to accommodate thirty persons, each to be supplied with 2,400 cubic feet of air per hour. The aggregate amount of air to be supplied will be 30 feet by 2,400 feet, or 72,000 cubic feet. Dividing this amount by 3,600, the number of seconds in an hour, we have 20 cubic feet as the amount required for each second. Dividing this by 5, the velocity allowable, we have 4, which represents the necessary area for the foul-air outlets in square feet.

It must, of course, be understood that the figures thus obtained represent actual opening, and not an opening partially obstructed by a grate or register. As before stated, 40 per cent. more must be allowed when the opening is covered by an ordinary register.

As regards the proportion of the area of the foul-air exits to the area of fresh-air inlets, it may be said that outlets should be at least double the area of the inlets, since a velocity of 10 feet or 15 feet per second may be allowed without injury or inconvenience at the inlet, although such a velocity would not be tolerable at outlet openings.

5. When a room is heated wholly or chiefly by warm air the distribution of heat in the room will be almost wholly controlled by the location of the foul-air outlets. The natural course of the air-current is this: the heated air rises to the ceiling, spreads out, and coming in contact with the outer walls, which are lower in temperature than the inside walls, especially the windows, it is cooled and falls to the floor. It is evident then that as the outer walls and the portions of the room adjacent to them are necessarily the coldest part of the room, the circulation of the air through the room and the proper distribution of the heat will be facilitated by placing the foul-air

openings along the outer walls and preferably under the windows. If the foul-air outlets are placed in an inner wall or at the floor near an inside wall one effect will be to draw toward this opening warm air which ought to have been utilised in warming the outer walls. Another effect, and one of the most disagreeable features attending this method of placing the foul-air outlets, is that the air which has been cooled by contact with the windows and outer walls and by its greater specific gravity has fallen to the floor, will be drawn the whole distance across the floor to the opening on the opposite side, thus constantly maintaining at the floor a stratum of cold air. An arrangement of this sort is a very frequent cause of cold floors, and consequently cold feet, and the resulting headaches from which the occupants of such a room are almost sure to suffer.

The foul-air outlets should be placed as near the floor as possible. The opening may be in the base-board or in the floor itself. The only objection to the latter method is the collection of dust which is likely to be swept into the opening.

6. The ventilating ducts communicating with the foul-air outlets should have a sectional area equal to the free area of the openings with which they communicate. This capacity should be maintained until the duct reaches the ventilating shaft, and should be increased if several turns are made in the duct, as each square turn has the effect to diminish the velocity of the air current nearly one-half. Square turns should never be made, and the ducts should be enlarged at the angles where a turn is necessary. In case a duct must be carried for some distance, its capacity should be increased 50 per cent. or even 100 per cent. to compensate for the great amount of friction occasioned by distance. The ventilating ducts should of course be made tight. For this purpose it is necessary that they should be lined with metal or some other durable material. Even well-seasoned lumber will shrink and open up large cracks, by which the efficiency of the duct will be very materially diminished. It is also a wise plan to construct ventilating ducts of some non-combustible material, or at least to line with such material as a caution against fire.

Only ducts coming from the same room or floor should be connected with the common ventilating shaft. Each storey must have its own foul-air shaft, otherwise the counter draughts occasioned by the opening of doors and windows, especially in moderate weather, or the adverse influence of winds, will be certain to lead to contamination of the air of one room by the

air of another room with which it is in communication through the common shaft.

It is of the utmost importance to supply each floor, and, if possible, each room, with its own independent ventilating shaft, running as directly as possible to the open air without any connection with other ducts.

7. The location, sectional area and height of the ventilating shaft are questions of very great interest and practical importance. As regards location, it is always better that the ventilating shaft should, when possible, be located within the building, as in an inside wall. This insures a temperature equal to that within the building, and so secures a constant and positive draught whenever the building is supplied with artificial heat. If, in addition, the ventilating shaft can be located adjacent to the chimney, or if the smoke can be carried up through it by means of a boiler-iron stack or a stack constructed of sewer-pipe, a still higher temperature of the air in the ventilating shaft and hence a better draught will be secured.

The sectional area of the shaft will depend upon the amount of air to be removed and the height of the shaft.

By a careful study of the tables of Parkes and others I have been able to construct a simple formula which is of great practical service in determining these two questions. The following is the formula:—The square root of the height of a shaft, multiplied by the square root of the difference in temperature between the air in the shaft and the outside air, divided by 4, equals the velocity of the air in the shaft in feet per second. In using this formula it is of course necessary that two of the quantities should be known. The difference in temperature is a pretty constant factor. In fixing this, the minimum difference should of course be chosen rather than the maximum, as a ventilating shaft which may have an ample capacity in extreme cold weather, when the great difference between the external and internal air would secure a powerful draught, would be quite insufficient to supply the necessary amount of air in moderate weather. I have chosen as a basis for obtaining the minimum difference in temperature the temperature of 45 deg. Fahr. for external and 70 deg. Fahr., the usual internal temperature. At a temperature much higher than 45 deg. doors and windows are likely to be opened, and hence the working of any ventilating apparatus would be interfered with. The difference between 45 deg. and 70 deg. is 25 deg., which may be fairly taken as a basis for calculation.

(To be concluded.)

THE STATE OF THE MERSEY.

THE acting conservator of the Mersey, Admiral Sir G. H. Richards, K.C.B., has just submitted his annual report on the navigation of the river to the Conservancy Commissioners, and therein he states that there are few and very unimportant changes in the features of the shoals and principal channels to record for 1894. This is, of course, excepting the dredging of the bar of the Queen's Channel. Of the minor changes the only ones worthy of note are a reduction in the area of the shoal patch eastward of the lightship—the depth on it at the least water is now 17 feet instead of 15 feet and 18 feet as formerly—and the continued operations of the silting process in the Rock Channel, not so much, however, at the entrance of the Bight of Hoyle as to the eastward of a line drawn north from the Leasowe Lighthouse, thence onward to the Rock Gate the depths continue to decrease. Vessels drawing 15 feet cannot now remain at anchor for a low tide to the eastward of R.I. Red Conical Buoy. The channel, however, says the conservator, has its value for navigation at tide time, and the coasting steamers which use it relieve the Queen's Channel traffic.

Dealing with the dredging operations at the Bar, the first three months of 1894 were, states Admiral Richards, unfavourable for dredging, nearly one-half of the time being lost. During the latter end of the year also the weather interfered considerably with the operations. The *Brancker* and two smaller dredgers removed during the first half of the year 2,831,740 tons of sand, of which quantity the *Brancker* accounted for 2,374,350, and during the second half the *Brancker* removed 1,451,050 tons from the Bar and 625,250 tons from Taylor Spit, the smaller dredgers removing 640,000 tons. This makes the total quantity of sand removed since the commencement of the work in September, 1890, to December, 1894, 8,935,980 tons, of which the *Brancker* has removed 5,050,650 tons. The results obtained are considered very satisfactory. At the end of June, 1894, the least depth of water in the 1,000 feet cut at low water of a spring tide falling 10 feet below Old Dock Sill was 20 feet, while in December the least depth at the same datum, and for a width of 1,250 feet was 22 feet, and for a space of 500 feet outside the buoys which mark the channel the depth was not less than 19 feet on the north side and 16 feet on the south side. The whole space of the cutting for a width of 1,400 feet had an average depth of more than 23½ feet at low water spring tides, though for navigable purposes it could only be taken at

the minimum depth. The bottom was uneven owing to the nature of the dredging, but the heavy gales of last year have had no injurious effect, their tendency, on the contrary, having been to level the floor of the cutting. It may be generally stated that vessels drawing 23 feet of water can enter the Mersey at low water tide; at one hour flood a minimum of 25 feet 6 inches; at two hours 30 feet 8 inches, and at three hours 35 feet 8 inches will be found during the lunitation.

The question of the deposit of excavations, dredgings, &c., states the conservator, becomes year by year more difficult, owing to the increased quantities to be dealt with coming from the Ship Canal and other sources. The Conservancy at the present time is almost wholly dependent for the proper disposal of dredged material on the co-operation of the several public bodies who control the different works from which it is collected. The staff of the marine surveyor, however, are always on the alert to ascertain the results of these deposits which are less likely to be injurious, at any rate in the navigable channel, since the dredging operations at the Bar have been in force and a system of monthly returns of the deposit of dredging has been established. The rock, clay, town refuse, &c., from all sources deposited during the year 1894 amounted to about 409,308 tons, and silt 2,293,545 tons.

With regard to the Manchester Ship Canal questions still exist, says the report, which may affect the integrity of the navigation of the Mersey. The most serious of these is that the tidal portion of the river at Warrington and for some miles below it has silted up, occasioning a considerable loss of depth, which has been partially caused by the diversion of the upper waters from their normal course. This has decreased the sectional area and tidal capacity of the river, and those navigating in that vicinity assert that since the canal was opened the tide does not rise so high as it used to do, and there can, in Admiral Richards's opinion, be little doubt of the correctness of these statements. The canal company are now undertaking work in the hope of remedying this serious condition of things.

The abstract of traffic through the several sea-channels recorded by the lightships, for both the inward and outward traffic, is 42,928 vessels, of which 37,559 used the Queen's Channel, and passed the Crosby lightship and Askew Spit, showing an average of 103 vessels daily using this channel in entering and leaving the port of Liverpool. The number of vessels using the Rock Channel was 4,980, and 389 passed through the Formby Channel. The full average of daily traffic

in and out of the port of Liverpool was 118 vessels. There were 1,489 vessels more than the total of 41,439 recorded as the traffic of the previous year. The Customs tonnage returns for the year 1894 are:—Inward 8,585,325 tons, outward 9,129,558 tons, being an increase, as compared with 1893, of 883,181 tons.

The lifeboats have been required on eleven occasions by vessels in distress, and 13 lives were saved. The water bailiff's return for 1894 shows 80 wrecks and casualties, an increase of 17 over the previous year.

A NEW ITALIAN LAKE.

To go to bed in a plain and to get up on the banks of a lake, to lie down an agricultural labourer and to wake a fisherman, is not a common experience, says the Florentine correspondent of the *Scotsman*, even in those days of telluric storm and seismic convulsion. Such, however, is precisely what has just happened, and not many miles from Rome. Alighting at the station of Monte Rotondo, famous for a Garibaldian victory, which preceded by a few days the Garibaldian defeat at Mentana on November 2, 1867, you proceed to Leprignano, not far from Castelnovo di Porto. This is a hamlet numbering about a thousand souls, chiefly agricultural in their calling. It stands some 600 feet above the sea level, on a plateau to the right of the Tiber, near the valley watered by the Gramicia torrent. Few visitors but those interested in Etruscan antiquities are ever seen at Leprignano, quite unattractive as it is, except for the ruins of Capena, that ancient Etruscan city whose importance may even now be gauged by the number and quality of its tombs. On the morning of the 8th inst., however, the little hamlet was conscious of a profound rumbling, the preliminary to further sounds of similar import, announcing the noise it is now making in the world. On the 12th and 13th the rumbling was repeated, and on the latter date it was found that the soil occupying a space of six hectares had collapsed, and that the vacuum had been filled with water, forming a quite respectable lake. Sulphurous gases bubbled up to the surface, disclosing the springs from which the lake is fed, while from its raw margin emanated similar exhalations, finding their vent through the numerous cracks that run their eccentric course around it. All the countryside turned out to witness the improvised sheet of water, and some young peasants, more adventurous than their fellows, advanced

towards the brink, only to feel the earth giving way beneath them and to get a good ducking. The extreme unsteadiness of the surrounding soil, indeed, favours the view that the lake will gradually widen in circumference, for already there have been landslips at various points of its margin, followed immediately by a rise of the water.

The phenomenon, as may well be imagined, is attracting much interest in the scientific world, and this morning, at the instance of the Prefect of Rome, a deputation consisting of Professors Meli and Keller, who hold the chairs of geology and physics in the University, started by the 10 A.M. train for Monte Rotondo and Lepignano. Reinforced by a civil engineer delegated by the Minister of the Interior, they will examine the phenomenon in all its bearings, and an interesting report of their findings may shortly be expected. Meanwhile it is satisfactory to note that nature is, so to speak, entering her protest against the mania of modern Italy for draining her inland sheets of water and destroying the amenity while not aiding the salubrity of the country. There was, perhaps, good ground for draining the Lago di Fucino, as from its site and its sudden risings disasters were from the oldest historical times associated with its presence. But to make this a precedent for the draining of Lake Thrasymene is what enlightened Italy, I am glad to think will not tolerate. The Lake Regillus has long ago disappeared from "under the Porcian height," and the gain to agriculture or to the reduction of malaria has not been so conspicuous as to compensate the loss of an old historic landmark. Rather should engineering energy be devoted to regulating the river courses throughout the peninsula—equalising their water-supply, so as to make them less like gravel pits in summer and more like fertilising streams in the autumn and spring. But this leads us on to the protection of the woods and forests, the reckless cutting down of which is the main cause of Italy's disastrous floods, now numbered by her as among her worst annual visitations. But this theme is of too great magnitude for the close of a letter, which must end as it began with a note of congratulation on the addition of a new lake to a region all too deficient in water-supply, and in the amenity and salubrity which such a natural resource almost invariably brings.

THE death is announced of Mr. Lee Hankey, at his residence near Malpas. Mr. Hankey was a partner in the firm of W. & F. Brown & Co., builders, Chester.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 7135. Holdsworth Akeroyd, for "Improvements in or appertaining to water-closets."
- 7138. John Shaw, for "Improved automatic down-cast and up-cast cowl for sewers, drains and other structures."
- 7155. William Edwards, for "A new or improved window fastener."
- 7173. John Frederick Spencer, for "Improvements in the constructional arrangements of buildings."
- 7218. Theodor Baldwin Wilcox and Henry Wilcox, for "Improvements in window fasteners."
- 7257. Thomas Walter Tucker, for "Improvements in draught excluders for doors."
- 7261. August Kiemchen, for "Improvements in roofing tiles."
- 7277. Stanley Smith, for "Improvements in or relating to drainage flooring or paving."
- 7382. William Murchland, for "Improvements in and connected with water-closets."
- 7487. James Laidlaw Wood, for "Improvements in sash fasteners."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

IN order to minimise the danger of fire, the authorities of the South Kensington Museum have decided to substitute concrete and mosaics for wood as materials for the floors throughout the east and west galleries, where the science collections and the valuable Indian section, including the silks and other fabrics, are situated. The work has already been commenced.

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern fitted with a Cistern Filter.

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. Vide Professor Frankland's Reports to the Registrar-General, July 1866, November 1867, and May 1870. The Lancet, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1873.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

BUILDING AND BUILDERS.

AT a mass meeting of the members of the Leeds Branch of the Amalgamated Society of Carpenters and Joiners, held in St. James's Hall, it was resolved to declare a strike, the Masters' Association having declined to accede to their demand of an increase from 8*d.* to 8½*d.* per hour, although the masters offered to meet the men to the extent of an increase to 8¼*d.* The original demand of the Society was an increase to 9*d.*

AT the annual meeting of the Durham and Northumberland Archaeological Society held at Durham, the Rev. Canon Greenwell, D.D., presiding, Dr. Greenwell was unanimously re-elected president, and amongst the new members elected was the Dean of Durham, Dr. Kitchin. It was agreed that the following places should be visited:—May, Darlington and Houghton-le-Skerne; May 9, special day in Durham Cathedral (recent discoveries); June, Blanchland, Edmondbyers and Wiggleswick; July, Alsica Roman Wall and Thirkwell; August (two days), Bridlington and neighbourhood; September, Snape Castle and Bedale.

A CENTRAL site has been purchased by the Leicester Corporation for the purpose of erecting new technical and art

HEWETSONS,

schools at a cost of 25,000*l.* The present buildings are unable to accommodate half the students.

AT the meeting of the Horsforth District Council a letter from the West Riding County Council was read, asking if the Council had taken any steps to provide Horsforth with an isolation hospital for infectious diseases, or, if not, what they intended to do. The consideration of the letter was deferred.

ACCORDING to the *Glasgow Herald*, in June an open competition will be held for a county surveyorship in Ireland. These posts are among the best which civil engineers can get in the public service, being worth at the start from 300*l.* to 400*l.* a year. The limits of age are twenty-six and forty, and the subjects of examination, which is in two parts, and covers ten days, include several branches of science, the strength and properties of materials, and a choice between railway and marine engineering. Competition is usually very keen.

A MEETING of Dundee operative masons was held in Buchan's Hall for the purpose of considering whether there should be a strike to enforce the demand for an increase of wages. There were between 300 and 400 present. It was stated that the National Executive had agreed to give the men financial support if they decided on coming out. After a long discussion a vote was taken by ballot for or against a strike. According to the rules there must be a majority of two-thirds before a strike can take place. On the votes being counted it was found that there was a majority of over fifty against leaving their work. At present builders in Dundee have 8½*d.* per hour and hewers 8*d.*

LABOURERS working to masons, plasterers and bricklayers in Falkirk and district have struck work for an additional half-penny per hour. They are at present receiving 5½*d.* The strike will prove a considerable drawback to builders, as a large number of new buildings are presently in course of erection, and preparations are being hurriedly made with a view to readiness for the term occuparcy. Work has already been a good deal interrupted by the recent joiners' strike.

A FIRE occurred in Jamaica Street Works, Dundee, occupied by the Boase Spinning Company, Limited, and before it was extinguished damage to the extent of between 2,000*l.* and 3,000*l.* was occasioned. While the firemen were working part of a wall fell on to an adjoining roof on which Captain Ramsay, John Ramsay and John Rodger, firemen, were standing. The falling masonry went through the roof, and Rodger was precipitated to the floor below.

THE new public baths and washhouses erected by the vestry of St. Mary, Islington, in Tibberton Square, Essex Road, have been opened by Mr. Shaw-Lefevre, M.P. The building, with the quadrangle in front, covers an area of 30,000 square feet, and contains three large swimming-baths, besides private baths and a public laundry.

AT Brussels the roof of the building destined to contain an exhibition similar to "Venice" in London suddenly collapsed. Many workmen were buried in the *débris*, fifteen sustaining serious injuries.

ELECTRICAL.

THE gas committee of the St. Helens Corporation have approved of plans for putting down plant at the gasworks capable of lighting the Town Hall and the Gamble Institute by electricity, and also for meeting any further immediate demands for extension of electric supply in the neighbourhood. The Parliamentary Committee have fixed 15*l.* per annum as the amount to be paid as compensation to Mr. Thomas Parkinson, ex-assistant overseer for the township of Eccleston, who was deprived of office under the Corporation new act.

THE electric light which has been recently installed at Dover is a decided success. The works cover an area of 10,000 feet. The buildings comprise engine and machine-room, 100 feet by 30 feet; boiler-room, 100 feet by 42 feet, giving space for seven sets of engines and seven boilers; testing-rooms, secretary's offices, board-rooms, &c. There have been two sets of electric-light machinery fitted up in the engine-room worked by two high-speed condensing engines of the marine type. Each engine works large armatures, or alternators, one containing twenty-four magnetic coils and the other twenty-two coils, giving 100 alternations per second. The smaller armature is the only one used at present in the supply to the arc lamps, but in time, when there is more demand for the light, the two will be worked together. Four more sets have yet to be erected, making in all six, which are to be placed in a parallel line, the armatures working in one long groove reaching from one end of the room to the other. The plant is elaborately fitted with contrivances which test and govern the engines and condensers. The engines, erected and to be erected, comprise four 100 Kilo-Watt machines, one 75 and one 50. The whole of the work is estimated to cost about 40,000*l.*, and it is stated that there is room in the grounds to

extend the works to twice their size if required. The town hall has been successfully lighted by electricity, and the churchwardens of Buckland have recently had light laid on to their church, where it was first used on Easter Sunday. The edifice is illuminated by means of eighty small lamps, which have given every satisfaction. Half the twenty-one lamps at present supplied with the current are kept going from sunset to sunrise—six on the Sea Front and four between there and the Market Square—and the remaining half are supplied from sunset till midnight.

VARIETIES.

WE regret to announce the death of Mr. William Saunders, M.P. for Walworth, which took place at Market Lavington on Wednesday morning last. Mr. Saunders, we understand, has been in ill health for some time past, and had only recently returned from the Riviera. The Central News Agency was founded by the deceased gentleman, but he would be more particularly known in the building trades as one of the original partners in the firm of Randell & Saunders, of Bath stone fame. Although for some years past Mr. Saunders had taken no active part in the business, he remained a partner until the amalgamation of the various Bath stone firms.

DURING the six months of the new tariff the imports of tin-plate at New York were 20,250,000 lbs. larger than in the corresponding six months a year earlier.

AN interesting exhibition of photo-ceramic enamels by various workers was opened in the Photogram Reading-room, Farringdon Avenue, last Friday. There was also a fairly representative collection of materials and apparatus for working the process, which was demonstrated at various periods during the day by Mr. W. Ethelbert Henry, who used one of Messrs. Fletcher, Russell & Co's patent gas muffle furnaces. An educational case (specially arranged by Mr. Henry) contained prints and transfers, showing the various stages in the production of photo-ceramic pictures, from the original transparency to the finished burnt-in result. Examples of under and over exposures, as well as a miscellaneous collection of "furnace failures," the cause of each being explained, were arranged by the same exhibitor, together with a useful set of "Rose-colour Test" tiles (specially prepared by Mr. Joseph P. Emery), and a series of tiles bearing specimens of fired colours by various manufacturers.

THE Glasgow Corporation have accepted the contract of Messrs. Clayton, Sons & Co., Leeds, for a three-lift gasholder, to be erected at the Tradeston Gasworks, Glasgow. The contract price is 24,028 $\frac{1}{2}$ l., the Leeds offer being 3,000 $\frac{1}{2}$ l. cheaper than those of the Scottish firms.

THE directors of the Boyne Navigation Co., Limited, are prepared to receive tenders up to June 1 for the supply and erection of twenty-seven pairs of lock-gates on their canal between Navan and Drogheda; also for sundry repairs to locks.

THE chimes at the Royal Exchange, which have been in existence for fifty years, have recently broken down, and the Gresham committee, which has the control of the fabric, has decided to improve and enlarge them. Hitherto, only four tunes have been played—"The Old Hundredth," "God Save the Queen," "Auld Lang Syne" and "The Roast Beef of Old England." The new arrangements contemplate twenty-one chimes, divided into a week of English, Scotch and Irish airs, each day playing a distinctive air. On Sunday the chime will be to a sacred tune, viz.:—"When I Survey the Wondrous Cross," "Hanover" and "Abide with Me." The chimes will be rung thrice daily—at nine in the morning, at noon, and at nine o'clock at night. They will be in working order soon.

ALL the plumbers at Leicester have ceased work under the lock-out notice of the employers in consequence of some of the men having struck work through the employment of a non-unionist. No effort at conciliation has been made. The joiners and carpenters still remain out, and their strike, which has already lasted five weeks, threatens to be very prolonged, a number of fresh issues having been raised. The employers threaten to introduce free labour. The unionists object to any piecework.

THE water committee of the Glasgow Town Council paid a visit to Killearn, and turned on the water into the Blane Valley section of the new Loch Katrine Aqueduct. This section forms part of the duplicate aqueduct from Loch Katrine, and is 5 $\frac{1}{2}$ miles long. The total length of the new aqueduct is 23 $\frac{1}{2}$ miles, so that the Blane Valley section is about one-fourth of the whole length. The aqueduct is in great part in tunnel. Altogether there are five tunnels, the longest being 1 $\frac{1}{4}$ mile. This section includes about five furlongs of a double line of 48-inch pipes and two bridges. The bridges are the only exposed parts of the aqueduct, it having been found advantageous to have as little of the work exposed to the weather as possible, as long

aqueduct bridges are affected by either heat or frost, as has been proved by the old aqueduct. The tunnel is lined inside with concrete for 75 per cent. of its whole length, this concrete lining being put in where the rock is soft, and crumbles when the air gets freely at it. The contract was let in March 1890, so that it has taken five years to finish. Mr. James Young, Glasgow, was the contractor, and Mr. John Pollock, manager. The total cost of this section has been 160,000*l.*, or 30,000*l.* per mile. The total length of the new aqueduct now open is 13½ miles, leaving 10½ miles still to be completed.

THE committee appointed to raise a fund sufficient to have the bridges at Bonhill and Balloch free from pontage on May 15 have been notified by the county treasurer that the amount required is 300*l.* This is a larger sum than the committee were calculating upon, but it is not expected there will be any difficulty in raising the deficiency.

MR. J. YOUNG will read a paper, entitled "The Dwelling-house from a Sanitary Point of View," at the next meeting of the Sanitary Inspectors' Association, which will be held at the Carpenters' Hall on Saturday.

A CATHEDRAL is proposed for Belfast. Canon O'Hara, the rector of St. Anne's, has promised a large donation, and 1,000*l.* has been promised by Lord Shaftesbury. It is stated that the cathedral will be built on the site of the present church.

THE choir of Bristol Cathedral, which has latterly been undergoing considerable alterations, is to be reopened on Sunday. The restoration of the Lady Chapel is now completed.

NEW CATALOGUES.

MESSRS. E. H. SHORLAND & BROTHER, of Drake Street Works, Manchester, have just published their new catalogue. We notice it is much larger than their former one, with many new designs of their patent Manchester grates, Manchester stoves and exhaust roof and other ventilators. Some of the new designs of the Manchester grates are decidedly handsome, with brass and copper canopies in repoussé work, whilst others are plainer and well suited for the public institutions for which they are specially designed; they all have projecting fireclay backs to throw the heat well into the room, in addition to their well-known warm-air ventilating arrangement. Interspersed in

the catalogue we notice the names of many leading architects and medical gentlemen, all bearing testimony to the excellency of the various appliances. Amongst their patent exhaust roof ventilators may be observed several new designs. The patent Manchester stoves are shown both single and double fronted, and with ascending and descending smoke flues in a variety of designs. These warm-air ventilating stoves, we are informed, are being largely used in hospital wards throughout the country, and are highly spoken of by those who have used them. A long list of places which have been warmed and ventilated by means of the patent Manchester grates and stoves is given in the catalogue. The catalogues are neatly bound in strong cover with index, and form a very useful book of reference for architects or anyone interested in warming or ventilation. The three different sections of the catalogue are printed on coloured paper, the Manchester grates being on white, the ventilators on pink and the Manchester stoves on blue tinted paper

THE WORKS DEPARTMENT OF THE COUNTY COUNCIL.

THE half-yearly report of the works committee of the London County Council on all the works which have been completed up to date has been presented. According to it the total estimated cost of the works was 176,886*l.*, while the actual cost amounts to 178,863*l.*, or an excess over the estimates of 2,777*l.* The committee instructed the manager to report to them the reasons for the increase of expenditure, and, in the course of a long statement of the causes which have contributed to the excess, he says that when the estimates were made up for the works the prices were based on the assumption that the workmanship and materials to be put in them would be accepted as satisfactory provided they were equal to those in the best specimens of buildings of their class in London. This, however, was found to be a delusion, and, instead of workmanship and materials of good ordinary quality being approved, workmanship of the highest standard and materials of the very best quality were demanded by the officers supervising the works. This same rigorous inspection was applied to all departments of the works, and, while it may have been prompted by a desire on the part of the officers to discharge their duties in the most zealous manner, in the opinion of the manager it had a most disastrous effect on the cost, and if the system had been designed to make the work

MAURICES

MAURICE'S PORCELEINE,

For Painting and Preserving Wood, Stone, Metal, Plaster, or any Surface on which Paint can be applied.

BRIGHTER THAN ENAMEL. EASY TO APPLY. NO BRUSH MARKS.

Cheaper than Paint and Varnish where a glazed finish is required. A Saving in Labour, only two or three coats being required on new work.

SAMPLES FREE TO ARCHITECTS AND BUILDERS.

FOR WALLS AND WOODWORK.—Maurice's Porcelaine is the best article in the market when a bright and durable finish is required; it is easy to work and gives a lasting glaze equal to China.

CEILINGS.—Our White is incomparable, and will keep its colour for years; it has binding qualities that prevent Ceilings from Cracking.

ENGINEERING.—For Iron or Metal-work of all descriptions it is a protective against Corrosion, and gives a beautiful finish, and on account of its heat-resisting qualities is in every way suitable for Stoves, Engines, Electrical Apparatus, &c.

All the above remarks are Guaranteed, being the results of Practical Tests.

MAURICE'S LIQUID GOLD.—This is valuable for Interior Gilding, being an improvement on Ordinary Gold Metallic Bronze Paints. Price, ready for use, 5s. per lb.

Write for Special Quotation for Quantities to

THE PORCELEINE CO., LANFRANC ST., LAMBETH, LONDON. S.E.

carried out by the Department cost as much as possible nothing could have been invented better calculated to bring about that result. The manager further states that other portions of the excess were due to the fact that for some time after the Works Department was established there was a tendency on the part of the skilled workmen not to do the same amount of work for the Council as they would be expected to do for a contractor, and it was only after repeated dismissals that this idea was shaken. With the unskilled labour there was, generally speaking, no cause for complaint. The statement concludes with the remark that the visits of individual members of the Council to the works are apt to be misconstrued. The men, he alleges, store up real and fancied grievances and relate them to the councillors in a most exaggerated form. The effect is most pernicious, and the manager thinks that very much better results would be obtained if councillors would refrain from entering into conversation with the men, who have ample means of making any complaints. The total deficit, including the initial expenses of starting and organising the Department, amounts to about 1¼ per cent. The committee think it is clear that painting cannot be done by the Council at the lowest competition prices, but in plain work, such as excavating, road-making, concreting or sewer-work, where quality of work cannot vary much, it is clear that work can be undertaken at contract prices.

DEMOLISHING PARTLY-ERECTED HOUSES.

FOR some time the main roads committee of the Flintshire County Council, says the *Liverpool Courier*, have been concerned with some new buildings which were being erected at Buckley for Mr. F. L. Hancock, a gentleman well known in hunting circles and resident at Wold House, Hawarden. The committee endeavoured to dissuade Mr. Hancock from encroaching, as they contended, upon the public highway in the building of the houses, but the work was proceeded with, with the result that it culminated in a novel and amusing scene a few days ago. The main roads committee decided that the buildings, which were about half completed, should be demolished, so far as they were believed to extend upon the highway, and Mr. Robert Lloyd, main roads inspector and about eight men employed by the Council arrived upon the scene to put the edict into effect. The proposed action on the part of the authorities had become

known in the neighbourhood, and a fairly large crowd gathered to watch the proceedings, but there was no attempt to interfere with the action of the authorities. In the first place, the County Council's employes pulled up about 100 yards of wire fencing in the vicinity of the new buildings, which enclosed a ditch adjoining the road. The bricklayers at work upon the scaffolding of the new houses were then requested to cease work, an order with which they readily complied. The front portion of the buildings was then speedily destroyed, the bricks thrown into Mr. Hancock's field, and everything cleared off the ground to the extent of about 6 feet. An incident of this character has not taken place before in this part of the country, and the action of the authorities caused great interest. We would not recommend the various county councils throughout the country to adopt the above method of asserting their rights, although it certainly is a novelty as to the legal rights in such a case. We should consider that it will result in an interesting lawsuit.

THE BUTE HOUSE ESTATE, PETERSHAM.

A SPECIAL meeting of the Richmond Town Council was held on April 30 for the purpose of considering the suggested purchase by the Government of the Bute House estate and its addition to Petersham Park. The amenities committee of the Council recommended the appointment of a deputation to wait upon the First Commissioner of Works and support the request of the inhabitants of Petersham that the Bute House property should be purchased by the Government and added to the park. The committee also recommended that the deputation should submit to the First Commissioner the great public importance of preserving the rural character of the landscape as seen from Richmond Hill, especially in regard of Petersham Meadows and parts of the Marble Hill estate, and invite the assistance of the Government in the matter. The recommendations were unanimously adopted and a deputation appointed. It was further resolved that the deputation should be empowered to approach the City Corporation and the County Councils of London, Surrey and Middlesex, seeking their assistance in the matter. A letter was read from the secretary of the National Society for the Preservation of Places of Historic Interest and Natural Beauty, asking that that Society should be allowed to add a member to the deputation. This was agreed to.

FORESTRY IN ENGLAND.

AT the meeting of the members of the Surveyors' Institution on April 29, the discussion on the paper on "Forestry," read at the previous meeting by Mr. G. Cadell, was resumed. Dr. Farquharson, M.P., as a landed proprietor, pointed out that every kind of tree wanted its own particular kind of ground, and one of the great difficulties in planting ground with trees was that of getting the proper seed. A difficult question in regard to forestry was that of the education of foresters. What was wanted was aid from the State, and public opinion upon this question should be aroused. It was necessary that the body politic should have this all-important matter brought to its attention, and that a strong public opinion should be raised which would demand that something should be done for what was really a great and important national industry. In the past tree cultivation had gone on in a wretched and haphazard way, and now the question arose how forestry was to be made profitable. There was a possibility that in the future foreign competition in regard to timber might be lessened, and that the home producer might have a fair chance with the products of his industry. Dr. Schlich (Professor of Forestry at Cooper's Hill) remarked that the preferential rates in regard to the carriage of timber given to foreign traders over English producers were simply heart-rending. There were 26,000,000 acres of waste land in England, and about one-fourth of that expanse might be easily made available for planting-out with trees. It was beyond all doubt that there were a great many areas in England which would be more profitable to plant with trees than to use for other purposes. Professor Marshall Ward, Mr. Wason, M.P., Mr. Stafford Howard (Commissioner of Woods and Forests), and other speakers joined in the discussion.

ACCIDENT AT THE BLACKWALL TUNNEL.

MUCH anxiety has been caused by the publication of an unfounded rumour to the effect that the Blackwall Tunnel had partly collapsed, and that twenty lives had been lost. The contractors (Sir Weetman Pearson & Son) have, in carrying out the work, adopted a hydrostatic shield, air-locks and other appliances, which have insured their workmen against such catastrophes. The tunnel is now being driven through Thames ballast, or, more correctly, through the puddled clay which has been put at a great expense over this thin gravel portion of the river-bed. What really happened about half-past 4 A.M. was a settlement of the clay covering into an existing cavity at the bottom of the shield where the head of river water above could not be balanced by a uniform air-pressure. This occurrence allowed a certain amount of air to "blow out," causing a water-spout about 18 feet in height. The temporary diminution of air-pressure thus caused allowed a quantity of water to get into the invert of the air-lock. As soon as the proper air-pressure was restored the tunnelling operations proceeded as before, the influx of water being pumped out by the pumps provided for such contingency.

THE BLAST AT PENRHYN QUARRIES.

A SPECIAL correspondent of the *Times* writes:—Until the afternoon of Saturday last (April 27) Y Talcen Mawr was the central point and perhaps the most striking feature of those famous quarries near Bethesda which have been in operation since the reign of Queen Elizabeth, and have changed half the rugged protuberance of the mountain called Bionllwyd into a deep amphitheatre. Many thousands of people who have visited the quarries must carry with them a memory of the Talcen. It was a rough slab-sided obelisk of grey rock, with a bold vein of white quartz at the summit. Its height from the bottom of the quarry was about 300 feet, and it was pierced at regular intervals with tunnels representing the level of operations at various periods in the past history of the quarry. At all times this great pillar of green rock presented a picturesque appearance, whether it was viewed from above or below, for the terraces, which the quarrymen call galleries, of purple slate, rising tier upon tier, one upon another, almost to the top of the mountain, formed a singularly effective background. Opinions vary as to the reason why this upstanding fragment of a dyke which ran across the centre of the quarry from north to south was suffered to

100a Queen Victoria Street, London, E.C.

remain, while the dyke itself was cut away on either side; but the better opinion is that a manager of the quarry who flourished at the beginning of the century, not foreseeing the colossal scale upon which the quarry would be worked in the future, hoped that this portion of the green rock might serve as a support for one side of the quarry. But the quarry grew beyond his expectations. The quarrymen cut through the dyke on either side, and left the Talcen in obelisk, which grew more and more picturesque and more and more dangerous every day and every year as the slate rock was cut away deeper and deeper at its base.

It was in August of 1894 that, after a report from Mr. E. A. Young, the chief agent, had caused Lord Penrhyn to make a personal inspection the Talcen was doomed, and the wisdom of the sentence was proved almost at once by the sudden fall, fortunately in the night, of a fragment weighing several tons, which, if it had fallen in the day, must have destroyed a large number of quarrymen. From that date till Saturday preparations for the great blast proceeded, and on Saturday the huge pillar, weighing 125,000 tons at the least, was demolished. The spectacle was imposing in the extreme. On the very brow of the quarry, fully 500 yards away from the scene of the coming explosion, and some hundreds of feet above it, a knot of privileged spectators was assembled near a flagstaff. The time was a few minutes past three. All along the brow of the quarry, and up on the slopes of the mountain above were crowds of spectators. All knew that in the bowels of the Talcen were two charges of powder, one of three tons and the other of four tons. At last the decisive moment came. The flag on the brow of the quarry was hoisted by the Hon. Miss Pennant. A blue wisp of smoke from the base of the pillar, and all present knew that the triplicate fuses furnished by Messrs. Bickford Smith & Co. had been lighted by Mr. Pritchard, and that the huge bricked-up chambers of powder specially manufactured by the Elterwater Company, and used rather than gelatine by reason of its gradual action, would do its work shortly. There was a silence of expectation for five minutes or so, an interval which was almost painful; but still the wisp of blue smoke rose lazily, and a little cascade of water on the Bethesda side of the rock fell down merrily. The minutes passed very slowly, but at last—sixteen minutes and a half after the flag had been hoisted—there was a crashing sound. The noise was not so loud as one would have expected. With it came an outburst from the base of the pillar of smoke, of minute dust and of something that was either flame

or red-hot powder of stone. Away from the top of the pillar sped two kestrel hawks which have nested there for many a year. The base of the great rock seemed to fall away as water falls from a fountain jet at its highest point. There was no sign of any stone being thrown to a great distance. Then, in less time than these words occupy in the writing, but in orderly sequence none the less, there was the roar of huge masses of stone rolling one upon another, and with it came the spectacle of the huge rock sinking and subsiding with a slowness that was almost majestic until it was a mere chaotic mass of boulders reeking with smoke, quivering and gliding downwards for many minutes like an avalanche. Another minute followed, and then the whole of the quarry was vested in a cloud of heavy and evil-smelling smoke, of which, however, the keen wind made short work.

RESTORATION OF BRISTOL CATHEDRAL.

READERS of the life of John Addington Symonds, says the *Bristol Times*, cannot but be struck with his enthusiasm for the Cathedral Church of Bristol, his yearning for it even in foreign travel and his delight at revisiting it after experience of far more imposing buildings. In his early days the cathedral, though half its present size, had twice its picturesqueness, its only approaches being down a steep flight of steps into the north transept, and a similar ascent from the cloisters into the south transept. A heavy stone screen, erected in the reign of Henry VIII., with minor prophets blazoned on the panels, and badges of the king and the youthful Prince Edward, surmounted by a later gallery and the present organ, shut in the choir from the vulgar gaze, the general effect being that of the decorous seclusion of a college chapel. The choir was then as left by the Reformation, and the episcopal throne—an erection like a four-post bed—had received all the bishops in due succession and many royal visitors. It is very gratifying to know that the ancient screen, having the initials "H. R." with the Tudor arms, and "E. P." with the badge of the Prince of Wales, deciding the date as between 1537 and 1547 (the birth and accession of Edward VI.), will be re-erected at the back of the new sedilia when sufficient funds are forthcoming.*

Many changes have taken place since those days, and before we chronicle the last phase of restoration now about to

* This screen was taken down in 1860, when the choir stalls were pushed eastwards for congregational purposes.

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing.

THE MARTYRDOM OF ST. STEPHEN. By E. J. POYNTER, R.A. Size, Forty Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

"AND THE SEA GAVE UP THE DEAD." By Sir FREDERIC LEIGHTON, President of the Royal Academy. A few Proof of this Fine Art Plate can be obtained (if ordered at once), price Two Shillings each. Free by post, carefully packed inside patent roller Two Shillings and Two Pence.

THE BANQUET. The well-known and beautiful Chromo-Lithograph by H. STACY MARKS, R.A. Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

1. AN OFFERING TO CERES. 2. THE EDUCATION OF BACCHUS. 3. MINERVA VISITING THE MUSES. 4. JUDGMENT OF MIDAS. By W. HAMILTON. Size of each plate, Forty Inches by Fifteen Inches. The whole forming a very beautiful Frieze in Bartolozzi Mezzotint. Price per set, Six Shillings on Proof Plate. Free by post, carefully packed inside patent roller, Six Shillings and Six Pence.

THE HISTORY OF JOAN OF ARC. By M. JULES EUGENE LENEPVEU. From the Wall Painting in the Panthéon, Paris. Four Pictures on one Plate. 1. Domremi: Inspiration. 2. Orleans: Struggle. 3. Reims: Triumph. 4. Rouen: Martyrdom. Size, Forty Inches by Fifteen Inches, on Proof Plate. Price, Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Six Pence.

THE WATERLOO HEROES. By J. P. KNIGHT, R.A. Dedicated, by Special Permission, to VISCOUNT WOLSELEY, K.P., G.C.B. Proofs, price One Shilling each (thin Plate Paper). Proofs (Special), price Two Shillings and Six Pence each (thick Plate Paper). Size Twenty Inches by Thirty-six Inches. Framed and Glazed in Oak, Complete, One Inch, Twelve Shillings each. Ditto, One and a Quarter Inch, Fourteen Shillings each. Ditto, One and a Half Inch, Seventeen Shillings each.

THE TOILERS OF THE DEEP. Two Tinted Ink Photographs. Size, Eighteen and a Half Inches by Thirteen and a Half Inches. Price Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Three Pence.

JOHN SELL COTMAN'S PICTURES, lately on Exhibition at the Burlington Fine Arts Club. The Plates are uniform in size, Twenty-one Inches by Fifteen Inches. The Titles are as follows:—1. Rouen from Mount St. Catherine. 2. Breaking the Clod. 3. View in North Wales. 4. Norman Arches. 5. Byland Abbey. 6. Norwich, from the Cromer Road. 7. Dewy Eve. 8. Mousehold Heath. 9. Cader Idris. 10. Castle Eden Dean, Durham. 11. Bamborough Castle. 12. The Interior of Norwich Cathedral. 13. Mountain Pass in the Tyrol. 14. Postwick Grove.

The price of the Set is Twelve Shillings and Six Pence; by post, carefully packed in patent roller, Thirteen Shillings. Kindly order early, as only a limited number of proof copies can be obtained.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publisher, P. A. GILBERT WOOD, 175 Strand, London, W.C.

be made public, it may be as well to glance hastily at the past history of this venerable building. This naturally divides itself into the pre-Reformation monastery and the post-Reformation cathedral. When Robert Fitzhardinge founded his Augustinian house on the rising ground to the west of Bristol, and began to build in 1142, he was following the example set him by his neighbour, Robert, Earl of Gloucester, the great patron of literature and the arts, who scarcely ten years earlier had begun to build the priory of St. James, to the north of the same city. Between these two monasteries in after years sprang up others, forming a continuous belt of religious houses, with their grounds sloping down to the banks of the river Frome, and making a picture difficult to rival anywhere. The House of the Gaunts, on the other side of the Green, with its orchard, still perpetuated in name; the Carmelites, with many pinnacles and spires, where Colston Hall now stands; the priory of St. Bartholomew, whose gatehouse still remains to us; the Franciscan Friars, with their noble church; and the nunnery of St. Mary Magdalen just above, and founded by Eva, wife of our Robert Fitzhardinge, make a list of which any city may be proud. Fitzhardinge died February 5, 1170, and was buried "atwix the Abbots and Piores stalles and next unto the Abbote's stalle in the intreyng into the quere." This would be beneath the western arch of the tower. Robert, Earl of Gloucester, was also buried in the choir of his church of St. James, in a tomb as seen and described by Leland.

The earliest portions of the building, parts of the south transept and staircase in the north aisle, and the gateway to the abbot's lodgings in the Lower Green, are recognised as belonging to the time 1142-48, while the later Norman (Transitional), the magnificent chapter-house, with its vestibule and the lower part of the great gateway, may be attributed to the later work of Fitzhardinge, 1155-70, when he had become enriched by the grants of the Berkeley estates. The Norman church had short transepts, still remaining in plan, and a short choir of three bays, with a square east end, as proved by the foundations discovered in forming the new pavement. In the early part of the thirteenth century an addition was made to this simple Norman church of the beautiful lady chapel, now known to us as the "elder lady chapel." The position of this chapel, east of the north transept, may be accounted for by the fact that the reverence paid to the Virgin had not reached its later development, when the place of honour, the east end of the choir, was invariably devoted to her worship. It is one of the finest specimens of the style of the thirteenth

century, even in its present mutilated condition, for originally it was detached from the north wall of the church, and certainly suffers by amalgamation with the main building. This chapel has been restored in a very conservative spirit, if we may except the removal of a sixteenth-century doorway of very inferior character, thereby causing certain antiquarian regrets. The boldness and depth of mouldings, relieved by exquisite foliage and grotesque figures, are well worthy of study, and remind one much of the north porch of Wells.

It would be to little purpose here to recount the several abbots who ruled the House until the dissolution, in 1539. The great builder to whom we are indebted for the church east of the transepts is Abbot Edmund Knowle, 1306-32. He has left a beautiful example of the Decorated style. The Norman choir had become ruinous, and possibly was considered of too small proportions for the increasing ritual requirements. It was, therefore, taken down and replaced by the present choir, with its aisles of equal height, the lateral stone transoms acting as internal flying buttresses to take the thrust of the central vault. The richness of the windows is enhanced by the use of a transome pierced with tracery, and the walls are relieved by deeply-recessed arches of the peculiar form known as the "Berkeley arch." The late Archdeacon Norris pointed out that Bishop Gower, who was at this time rebuilding the nave of St. David's Cathedral, was a friend of Knowle's, and reproduced these recesses in his own work. It is curious to conjecture the possibilities which might have arisen to this church had the abbot not declined sepulture to the body of King Edward II. The wealth which poured into the abbey of St. Peter at Gloucester would then have been diverted to Bristol, and the church might have been rebuilt on a far grander scale. Abbot Knowle died in 1332, and was buried, according to the roll of Abbot Newland (discovered a few years ago at Berkeley Castle), "under a brode marbull stone streight afore the rode auter." Tradition has assigned to him a place by the high altar; and as, at the Reformation, the holy table was erected at the extreme east end, the tomb of the abbot on the north side was assigned to Knowle, whereas the high altar undoubtedly stood immediately beneath the enriched groining between the fourth and fifth bays, to which position the holy table is now happily restored. But it was "afore the rode auter" that Knowle was buried, and this was an altar west of the rood screen, which doubtless formed its reredos. No such mistake attaches to the tomb of Abbot Newland, 1481-1515, whose rebus of a heart pierced with nails

(Nailheart) occurs on the effigy on the south of the eastern lady chapel. But before this "new works" were being constructed by Walter Newbury (abbot 1428-73), stone in quantities being brought from Dundry, no doubt for the reconstruction of the nave in continuation of Knowle's work. During his abbacy the central tower was rebuilt. To Abbot Elyott (1515-26) we owe the stalls and the interesting miserere carving, illustrating the tale of Reynard the Fox, so popular in the Middle Ages. According to the roll at Berkeley Castle, Abbot Newland "bielded the gate house," by which is meant, no doubt, the upper part, and possibly he may have reworked the Norman mouldings below, as suggested by the late Mr. E. W. Godwin, who gives good reasons for this opinion in a paper published in the *Archæological Journal*, vol. xx. He is also supposed to have reconstructed the roof, with the vaulting, and the windows of the transept. This brings us to the dissolution, when Henry VIII. converted the building into a cathedral for the use of the newly-created see of Bristol, which with Gloucester was carved out of the diocese of Worcester. The work of rebuilding the nave was then discontinued, and it appears probable that what was still standing of the old Norman nave was taken down, but by way of substitute a short nave was formed by placing the altar at the extreme east end, erecting a great screen across the second bay from the tower, the stalls occupying the two next eastern bays.

In 1850, when Dean Elliot came to Bristol, he found the cathedral in a dilapidated and disgraceful condition. The walls and piers were covered with yellow wash, the windows were decayed and broken, and the east end of the building was overlaid with earth to a depth of several feet. Between 1860 and 1866 the Dean reglazed all the windows, with the exception of the great eastern window, removed the earth from the east end, and discovered and restored the beautiful sedilia on the south side of the eastern lady chapel, as well as the tomb on its north side. He also removed the yellow wash from pillars, walls and groining, and caused the roof to be decorated and its bosses gilded. The old bishop's throne and organ screen were removed, the stalls rearranged with much new carving, and provision was made for lighting and warming the cathedral.

Besides these improvements, the eastern cloister was restored and glazed, and—most important, perhaps, of all—the large piers under the central tower were underpinned and rendered secure. No less than 20,000*l.* was spent upon these works.

In 1866, Canon Norris started a bold movement for rebuilding the whole of the nave, instead of two or three bays, as previously proposed by the Dean and Chapter. The work was entrusted to Mr. Street, who with great judgment determined to follow Knowle's construction. Mr. Street's design included two western towers. The nave and the western towers up to the level of its roof were completed in 1877, at a cost of 48,000*l.* In 1886 Mr. J. W. Dod offered 5,000*l.* towards the completion of the western towers, in accordance with Mr. Street's designs. Further sums were raised, and by June 21, 1888, Mr. Pearson, who on the death of Mr. Street had become the architect to the Chapter, carried out this work at a cost of 8,000*l.* In the same year a sum of 3,100*l.* was expended in effecting the complete restoration of the fifteenth-century gate-house and the old Norman archway of the abbey. Thus during the lifetime of the late Dean some 88,000*l.* were spent on the cathedral.

If we except the restoration of the north transept in 1890, with its beautiful window filled with stained-glass by Powell, given by the Dolphin Society to the memory of Colston, no important work was carried out in or about the cathedral after this until June 13, 1892, when a meeting was held in the Merchant Venturers' Hall, at which the Lord Bishop of the diocese presided. The ruinous and unsafe condition of the central tower and elder lady chapel and the defects in the choir arrangements were duly considered, and it was resolved that "the cathedral be without delay restored." This spirited resolution has not been allowed to fall through. By March 1893 the present dean, Dr. Pigou, was able to commence the restoration of the tower and elder lady chapel; not long afterwards the new choir arrangements were undertaken, and the restoration of the north cloister, all of which works are now completed.

The restoration of the tower is perhaps one of the most successful of the day. Every stone of the old tower that was sound has been carefully preserved and replaced. The new stone used has been taken from the same quarry on Dundry as that from which the tower was originally built, and the pitch of the lofty north-east pinnacle has been carefully preserved from the indubitable evidence of the stones at its base found *in situ*. The result is most harmonious and imposing. In the restoration of the elder lady chapel also great care has been taken to leave untouched the beautiful and almost unique carving in the capitals and spandrels of the arcades, and the introduction of an additional order in the fine western archway, though a

bold stroke, must be admitted to be an æsthetic improvement, as well as justified by the necessity of strengthening an arch which has to transmit the thrust of the tower to the new and massive external buttress. The east window, by Hardman, is a beautiful specimen of modern glass. Coming to the choir, a very fine effect has been obtained by restoring the altar to its proper position, seen through a vista of handsome choir stalls, and standing on a sumptuous marble base. In this respect Bristol now surpasses many other English cathedrals.

The restoration of the central tower (completed July 1892) cost 4,896*l.* That of the elder lady chapel (opened January 6, 1892), cost 1,866*l.*, to which must be added 220*l.* for the grilles and 30*l.* for the altar rails. The marble paving of the choir (by Davison, who did the work at Truro and St. Paul's) has cost 1,300*l.*, and the reconstruction of the stalls, by Luscombe, of Exeter, from Mr. Pearson's bold and handsome designs, 1,389*l.*

Two artistic wrought-iron screens separate the choir from its aisles east of the stalls, and a dossal and side curtains have been temporarily provided. The whole building is now lighted by electricity, the brass electroliers being the work of Singer, of Frome. Thus far the total cost of this present restoration has reached about 12,000*l.*, of which a debt remains of at least 1,200*l.*

Much has been done, but indeed much remains to be done. A choir screen (the base only of which has been erected), a reredos, sedilia, bishop's throne, pulpit, organ and bells have still to be provided; and, in addition to these internal improvements, it is estimated that about 5,000*l.* should immediately be spent on the restoration of the eastern exterior of the building.

QUARRYING.*

At the very outset let me point out that it is by no means easy to define exactly what a quarry is. You will probably say that that is a somewhat strange prelude, when the lecturer candidly confesses that he cannot explain precisely what he is going to talk about; but I will tell you in a moment where the difficulty lies and why it is necessary to lay some stress upon

* One of a course of five lectures on "The Sanitation of Industries and Occupations," delivered before the Sanitary Institute by Mr. C. Le Neve Foster, B.A., D.Sc., F.R.S.

this question of definition, "What is a quarry?" If I were to put this question to you most would reply without hesitation, "A quarry is a place where stone is dug." This is a good popular definition; the classical scholar might base his reply upon the origin of the word and say that it has come down to us from the Low Latin word "quadraria," meaning a place where squared stones were "got," the verb "quadrare" signifying "to make square." The "quadrarius" or "quarryman" was originally the stone-cutter who trimmed stones into shape for building purposes. It is easy to understand that the term quarry eventually denoted any excavation made for getting stone, whether dressed into cubical or parallelopipedal forms or sent into the market in irregular lumps.

When we come to look at the question from an official point of view, the popular explanation has to give way to strict definitions laid down by Acts of Parliament or ascertained by legal decisions.

In the first place many excavations, which are popularly known as "quarries" because stone is obtained from them, are legally "mines." We thus at once must make the distinction between—(1) Workings open to the sky; (2) workings underground.

Judicial decisions have settled very clearly that in this country it is the nature of the excavation which determines whether any given workings are a "mine" or not. If the mineral is obtained by underground passages and chambers under a cover of rock, the workings are legally "mines." Where stone is obtained such workings are popularly known as "underground quarries," and they are more numerous than many persons think. About one-third of the slate of Wales and most of the Bath stone is nowadays quarried in underground chambers, that is to say legally it is "mined."

On the other hand, if we cross the Channel a different state of things prevails. Workings for minerals in France are classified according to the nature of the substance and not according to the nature of the excavation. If iron ore is being worked, the undertaking is designated a mine, even if it is merely a shallow pit open to daylight, whereas underground workings for stone, no matter their depth and complexity, enter into the category of "quarries."

This essential distinction between the laws of the two countries must be borne in mind in making international comparisons of death-rates from diseases or accidents.

Having pointed out that much stone is got by true mining operations, let me now turn to workings which are open to the

sky. There are no less than three legal definitions of "quarries," which I will take according to the dates of the statutes.

1. *Factory and Workshop Act*, 1878 (41 Vict. ch. 16), fourth schedule (25):—"Quarries, that is to say, any place not being a mine, in which persons work in getting slate, stone, coprolites, or other minerals."

2. *Quarry (Fencing) Act*, 1887 (50 & 51 Vict. ch. 19), section 4, says:—"The term 'quarry' includes every pit or opening made for the purpose of getting stone, slate, lime, chalk, clay, gravel or sand, but not any natural opening."

3. *Quarries Act*, 1894 (57 & 58 Vict. ch. 42), section 1, reads thus:—"This Act shall apply to every place, not being a mine, in which persons work in getting slate, stone, coprolite or other minerals, and any part of which is more than 20 feet deep."

It is not necessary for my purpose to-night to bind myself closely to any one of these definitions; I merely point them out to confirm my opening statement that it is not easy to state exactly what is meant by a "quarry" in the United Kingdom.

I think that it will be convenient, for the purposes of this lecture, to regard as quarries any underground workings for stone, and all other workings for minerals which are directly open to the sky, and which may conveniently be comprised under the term "open works."

2. Kinds of Minerals Worked.

The minerals we have to deal with are very varied; indeed it may be said that practically every kind of mineral has at the outset been got by open workings, and even at the present day very large quantities of metallic ores are obtained in that manner without any burrowing underground.

Among the minerals worked opencast are alumstone, asbestos, brick-earth, chalk, clay (including china-clay, fire-clay, fuller's-earth, potter's clay), coal, and more especially brown coal, copper ore, gems, gold, gypsum, iron ore, iron pyrites, lead ore, nitrate of soda, phosphate of lime, stone of all descriptions, strontium sulphate, tin ore.

From a geological point of view the deposits worked are likewise very varied; sometimes they are stratified and have been formed by the deposition of sediment in old seas or rivers, by the growth and accumulation of animal or vegetable organisms, or by precipitation from solutions; in other cases we have to deal with rocks which were at one time in a fused or plastic condition, and which are said to be of igneous origin. In fact, any portion of the earth's crust which can be utilised

in the arts or manufactures may be obtained by a quarrying process.

3. Processes of Excavation.

With substances varying in nature from the loose sand to hard granite, it is evident that the processes employed in "getting" must be numerous. The excavation may be effected by manual labour or with the aid of machinery. The simplest hand tool is the crowbar. It is thrust into cracks and joints, and by using it as a lever blocks of stone are prized off. Next come the pick and shovel, familiar tools in almost all workings for minerals, differing more or less in form according to the precise substance for which they are used. Wedges driven in by sledge hammers may be called to the aid of the quarryman to detach his blocks of stone; and lastly we come to blasting operations, by which so much mineral is forcibly wrenched off from its bed.

The jumper, that is to say, a bar of iron steeled at the end and forged into a chisel-shaped "bit," is an implement frequently seen in open works for boring holes to receive the explosive; short holes are likewise made by striking a steel chisel (borer) with a steel hammer or sledge.

The powerful explosives, which owe their strength in the main to nitro-glycerine, such as dynamite, blasting gelatine and its congeners, though very largely used, have not yet displaced the old-fashioned gunpowder. The latter holds its own in many cases where the rock has to be wrenched off gently, so to say, and where the smashing action of the high explosives would more or less spoil the material which has to be extracted.

The excavating machines used in quarrying may be classified as follows:—

1. Diggers. 2. Dredgers. 3. Boring machines. 4. Groove cutters.

1. Steam diggers, known sometimes in this country as "steam navvies," and in the United States as "steam shovels."

These gigantic diggers are employed not only by railway and canal engineers, but also by quarry owners. Sometimes their business is simply to remove over-burden; in other cases they dig up the valuable mineral itself, such as iron ore or even auriferous gravel. In the Mesabi Range, Minnesota, iron ore is excavated in open workings and at once loaded into railway waggons by the steam shovel.

2. One naturally associates the dredge with workings under water, but in addition to being used for excavating gold-bearing sand and gravel from river bottoms, it may render useful services upon *terra firma*. A dry dredge with an endless chain

of buckets is employed for stripping off a thick layer of gravel covering a bed of brown coal near Cologne, and Priestman's grab dredge might have been seen not long ago digging up brick earth in the vicinity of London.

3. Rock drills—that is to say, machines which bore holes for blasting—are at the present day rendering immense services to the quarryman. They relieve him from a toilsome labour, and insure a rapidity of work which was previously unknown. An ordinary percussive rock-drill is merely a cylinder with a piston driven backwards and forwards by steam or compressed air, and a cutting chisel attached to the piston-rod. The chisel is therefore made to strike its blows mechanically with great force, and the number of shot holes which can be bored in a given time is very great.

4. Though rock suitable for many purposes can be obtained by ordinary blasting, this process is out of place when it is necessary to quarry such a material as marble. Blasting would get out irregular lumps and would shatter the rock, or at all events produce cracks, whilst the object of the worker is to obtain perfectly sound blocks of parallelopipedal form. Various groove-cutters are in use, which enable the quarryman to effect his purpose. An old machine, but one still largely used in the United States, is the Wardwell channelling machine. It is an appliance in which steam power replaces manual labour in working jumpers. Three or five chisels are arranged side by side, and are lifted and dropped by a steam cylinder so as to chip out a vertical groove. Smaller machines have now been brought out by the Ingersoll and Sullivan companies.

Instead of chipping out a long groove, it is sufficient in many cases to bore out a series of holes along a given line, and then break down the intervening partitions with a special tool. Machines for this purpose are largely used in the United States.

A large circular-saw mounted upon a suitable carriage which cuts vertical grooves 30 inches deep is likewise of American construction. One of the most ingenious groove-cutters is Wilmart's wire saw, which has been employed with success at a Belgian marble quarry for upwards of ten years. Three iron or soft steel wires, each a quarter of an inch in diameter, are twisted into a strand and are made to form a long, endless cord, which is drawn by machinery over the surface of the rock, whilst sand and water are fed on to it continuously. The sharp grains of sand are caught in the interstices between the wires, and as they are dragged along they cut the stone which lies in their path. Then pulleys which guide the wire

saw are fixed upon frames in little pits specially excavated for the purpose at each end of the cut, and are duly lowered as the work proceeds, so as to keep the wire cord upon the bottom of the groove.

Two other special methods of excavation deserve mention, viz. processes depending upon the action of heat and upon the action of water.

It is probable that "fire-setting" is one of the oldest forms of mining and quarrying, and in spite of the discovery of the new and more powerful explosives it has not entirely died out. The effect of the fire is to crack and split the rock, and to render it easily removable by the pick, crowbar or wedge.

In the island of Naxos emery is quarried exclusively by fire-setting. A pile of brushwood is heaped up against the rock and lighted. When it has burnt out in about two or three hours water is thrown upon the heated rock, and the sudden chilling produces fractures which enable lumps of emery to be got out easily. Jade is quarried in Burmah, and stone in India in the same fashion.

Water serves a useful purpose for getting china clay in Cornwall and Devon. The granite in these counties is sometimes thoroughly decomposed, owing to the conversion of the felspar into kaolin. Where the existence of such a mass of suitably decomposed rock has been proved, the over-burden is stripped off and a shaft sunk; its bottom is put into communication by a tunnel with another shaft, sunk in the adjacent hard granite and fitted with pumps. Water is led on to the soft decomposed granite which the workman loosens with a pick; the milky stream flowing away from the working face is led into a settling pit near the top of the first shaft, where it deposits coarse grains of quartz. It now drops down the shaft, runs along the tunnel, is pumped up to the surface and led away to settling pits.

The hydraulic mining of the United States is carried on by playing upon banks of gold-bearing gravel with jets of water under considerable pressure. Vast works are undertaken to provide adequate supplies of water, which is stored in high reservoirs created by artificial dams and then led for miles by ditches to the points where it is required. Valleys are crossed by iron pipes or by troughs carried by trestles.

The huge jet of water issuing from a nozzle under the control of a workman is directed against some part of the gravel band and made to undermine it. Great masses fall and are disintegrated by the spouting water; the result is a muddy stream, which flows away hurrying along with it sand, gravel

OPTIMUS SUPERIOR PHOTOGRAPHIC OUTFITS. EXTRA LONG FOCUS CAMERA.

British Journal of Photography says:—"The present model Rayment Camera is among the very lightest of actually rigid cameras offered to the public. The rapidity of opening and closing is greatly facilitated by the additional arrangement for throwing the pinion out of gear from the rack. There is no curtailment of view when lenses of short focus and wide angular aperture are in use. All movements necessary to the modern scientific photographer are included in this compact instrument."

Including Rayment Camera, Three Double Dark Slides, "Optimus" Rapid Rectilinear Lens, Instantaneous Shutter, Tripod Stand, Waterproof Case, complete—

and boulders, and all the gold. It is conducted into long lengths of wooden troughs, specially arranged for catching the gold by the aid of quicksilver.

These two processes by fire and by water are exceptional. I now proceed to say a few words about the ordinary methods of arranging the quarry workings.

4. Methods of Arranging the Workings.

As already stated, the mineral may be quarried in two ways:—

1. By pits open to the sky.
2. By underground mining.

The shape assumed by the actual excavation must depend greatly upon the nature of the mineral and its solidity. Hard solid rock, like limestone or granite, may be allowed to stand up in high and almost vertical faces, whereas less stable materials, such as clay and sand, would slip in or run in if one tried to treat them in like manner.

A very simple process of working is that adopted in Chili for obtaining nitrate of soda. The impure nitrate (*caliche*) is found in beds from 6 inches to 12 feet thick beneath a covering of hard conglomerate (*costra*) from 1 to 10 feet thick. A small shaft is sunk a little below the bottom of the *caliche*, and enlarged in order to receive a charge of slow-burning powder made on the works. The explosion loosens and breaks up the ground over an area about 20 yards in diameter. The hard overlying stratum of *costra* is then easily removed, and the *caliche* is broken up into lumps, which are taken to the lixivating and crystallising works.

Working in steps, stopes, terraces, benches, lifts or galleries, for all the terms are used, may be looked upon as the typical method of quarrying, and we may find examples in the case of many kinds of ores and stones.

The great Penrhyn slate quarry near Bangor is well known to all tourists in North Wales. The valuable slate and the valueless over-burden are both taken away by a series of terraces on an average 60 feet high by 30 feet wide.

The lead-bearing sandstone of Mechnich was at one time worked open-cast on a very extensive scale. At the present time the underground workings are of more importance.

The famous iron ore of Styria is mainly worked open-cast, or to use what is now the legal expression in this country, is "quarried." There are in all nearly fifty terraces, in fact the workings may be looked upon as a gigantic flight of stairs 1,500 feet high, the tread of each step being on an average

36 feet. These workings in Styria produced in 1891 about three-quarters of a million tons of iron ore. If the rock is firm enough to stand alone for a great height, it is sometimes taken down in one vertical slice, without making a series of steps.

Much chalk is quarried in the neighbourhood of Rochester, for instance, in a somewhat similar fashion.

A last method of quarrying is by gigantic blasts, which bring down thousands of tons of stone at a time. It is practised in some limestone quarries in this country, both in North Wales and in Derbyshire. A tunnel is driven in to the face of the quarry, and a chamber is excavated for the reception of explosives. The tunnel is now filled up with earth or masonry, or both, and the charge is fired by a long fuse, or by electricity. The result is the displacement of thousands of tons of rock, the clearing away of which may occupy the quarrymen many months.

In quarrying limestone near Messina, a charge of 31 cwt. of powder in bags was placed in a special chamber at the end of the tunnel, driven into the face of the quarry, and the tunnel having been duly tamped, the powder was fired, bringing down no less than 100,000 cubic yards of rock. Granite has been quarried at Baveno, on the Lago Maggiore, in a like manner. In 1886 a monster blast of 17½ tons of gunpowder and half a ton of Nobel's dynamite were exploded simultaneously, displacing 500,000 cubic yards of granite. Twenty or thirty blocks of from 1,000 to 6,500 cubic yards each were carried fully 300 yards by the explosion. A block of 6,500 yards would be represented by a cube of 55 feet on the side.

As will be naturally understood, the task of removing waste rock or earth often lying above the useful mineral increases with the thickness, until at last a point is reached when it will no longer pay to work the quarry open. The quarry-owner then endeavours to devise some method of excavating the valuable material by itself, leaving the waste rock as a roof. This leads him to true underground mining, which from a strictly legal point of view is beyond the scope of my lecture. However, when stone is obtained from such excavations, they are popularly known as quarries, and on this account they deserve a word of mention.

As the material quarried is usually of small intrinsic value, the cheapest method of supporting the roof is to leave portions of the deposit unworked. This method is employed in working slate at Festunio, in Merionethshire. The beds of slate are sometimes more than 120 feet thick, and are worked by chambers separated one from the other by thick partitions of

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

PROOF IMPRESSIONS of the BEAUTIFUL ART PLATES which appeared in the New Year's Double Number of "THE ARCHITECT," and in the Number for January 10, 1890, THE TOILERS OF THE DEEP. Two Tinted Ink Photographs (size 18½ in. by 13½ in.), may now be obtained, price 1s. each. Free by post, carefully packed in patent roller, 2s. 3d.—GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

rock ; in other words, a huge wall of slate, 30 or 40 feet thick, is left standing between every two chambers of like dimensions. Two or three beds may be worked one above the other, care being taken that the position of the pillars shall coincide. The chambers themselves are huge caverns, the roof of which may be more than 100 feet above the heads of the workmen.

Wales is not the only part of the world where slate is obtained in underground quarries. France and Germany afford examples of similar, or somewhat similar, workings. At the slate quarries near Fumay on the Meuse, and Rimogne, near Mézières-Charleville, the men fill up the chambers with rubbish, and stand upon it while at work.

5. Transport.

A word must be said about the methods of bringing the product of the quarry from the workings to the places where it is made fit for sale.

These methods vary very considerably according to the situation and size of the workings. In some places, as already mentioned, the mineral is loaded in the quarry directly into railway trucks and sent away without any preliminary treatment whatever ; in others it is lowered down the sloping sides of mountains or raised from deep pits. At the celebrated Carrara quarries blocks weighing from ten to forty tons each are lowered in a very primitive fashion down rough inclined planes by means of ropes twisted round posts, which are set up at regular intervals. The usual method is to construct self-acting inclines, the weight of the descending loaded waggons drawing up the empties.

When the quarry is a pit which cannot be tapped by a tunnel, the mineral may be drawn up inclined planes by any available source of power or it may be lifted by a crane or an aerial incline. This latter device is largely used in North Wales and in Scotland, where it is known as the "Blondin." It has the advantage of being easily and cheaply erected and of being capable of picking up the load of mineral at various parts of the bottom of the pit.

6. Preparation of the Mineral for the Market.

As a rule, the mineral coming away from the quarry requires treatment of some kind before it is brought into a condition fit for the purchaser. Considering the variety of substances which are quarried, viz. metallic ores, gems and all kinds of stones, it would be impossible for me in the limits of this lecture even to hurry through all the processes which are in use. The

great subject of "dressing" could not be dealt with properly in less than a dozen lectures. I shall therefore limit myself to mentioning a few of the purely mechanical processes employed in the case of stone.

One important branch of the preparation of stone for the market is the manufacture of "setts" or paving stones. The Scotch workman, sitting down at his work, by dexterous blows of a hammer, which has a slightly concave face, splits the blocks across so as to form the paving stones he requires. The Carnarvonshire man stands and does his work in a bent posture.

The manufacture of road metal is carried on on an enormous scale in the Charnwood Forest district of Leicestershire, and likewise at Penmaenmawr in North Wales. The blocks of stone coming from the quarry are first reduced in size by a stonebreaker, that is to say, a machine with two huge jaws, which crack the stone just as we should a nut with the teeth ; the broken stone then falls between two revolving toothed rolls, the stone is once more cracked and has simply to be passed through sieves in order to be separated into the different sizes required for various trade purposes.

In the case of slate, the blocks coming from the quarry, sometimes weighing a ton or two, are split by wedges into slabs about 3 inches thick, which are sawn across into the lengths required and then skilfully split by thin chisels. The thin sheets are "dressed" into the well-known rectangular shape, either by hand choppers or knives worked mechanically.

THE VENTILATION OF BUILDINGS.

(Concluded from last week.)

THE height of the ventilating shaft is usually determined by the architect, who considers it with reference to the architectural effect in the building. When this is given, we have but to take the square root of the known height of the chimney, multiplied by the square root of 25, which is 5, divide the product by 4 and we have as a result the velocity at which the air will travel in the shaft in feet per second. It only remains to divide the total number of cubic feet to be removed per second by the velocity of the air per second, and the result is the sectional area of the shaft which is sought. Let us take a simple example by way of illustration. Given the height of the shaft, 50 feet, and the amount of air to be furnished

72,000 cubic feet per hour or 20 feet per second, the formula would work out thus:—

$$\frac{\sqrt{50} \times \sqrt{25}}{4} = \text{Vel. in ft. per sec.} = 9 \text{ ft. } \frac{20}{9} = 2.22 \text{ sq. ft.}$$

the necessary sectional area of the shaft.

If the area of the ventilating shaft is given, the height being left to be determined, it is only necessary to know the amount of air to be removed, the difference between the internal and external temperatures, and to fix upon the velocity at which the air shall travel. The sectional area of the shaft must often be determined by the conveniences of construction, being governed by the plan of the building. A very safe rule is to make the sectional area of the ventilating shaft equal to the combined sectional areas of all the ducts leading into it. It is possible to secure efficient ventilation with a ventilating shaft which is somewhat smaller than this, but this is unquestionably the safest rule to follow. To determine the rate at which the air will travel, it is only necessary to divide the amount of air in cubic feet required per second by the sectional area of the shaft expressed in feet. With these data, the determining of the required height is a very simple problem, using the formula which has already been given. An example will make this entirely clear.

Let us suppose that the conditions are as follows:—Air is required for forty-eight students. At 2,400 cubic feet per hour for each, the total amount needed would be 115,200 cubic feet per hour, or 32 cubic feet per second. The combined area of ducts of sufficient size to allow the transmission of this air at the rate of 5 feet per second would be $32 \div 5 = 6.4$ square feet, and the velocity will, of course, be 5 feet. The question we have to solve is what would be the necessary height of the ventilating shaft to secure this velocity, the difference in temperature being 25 deg. Fahr. The solution of this very practical problem is extremely simple. Bearing in mind the formula, we will let H represent the height of the shaft, D the difference between the internal and external temperatures and V the

velocity of air per second; $\frac{\sqrt{H} \times \sqrt{D}}{4} = V$. Substituting the quantities which are known we have the following:—

$$\frac{\sqrt{H} \times \sqrt{25}}{4} = 5.$$

Reducing, we have $5\sqrt{H} = 20$, $\sqrt{H} = 4$, $H = 16$; that is, the height of the shaft required by the conditions named would be

16 feet. In most instances it is more convenient to employ a smaller shaft and one of greater height. Let us suppose such a case, in which the amount of air required per second is the same, namely, 32 cubic feet per second, and the sectional area of the shaft 4 square feet instead of 6. Dividing the amount of air required per second by the area of the shaft, we have 8 as the velocity per second ($32 \div 4 = 8$). Our formula then would

be as follows, $\frac{\sqrt{H} \times \sqrt{25}}{4} = 8$; reducing we have $5\sqrt{H} = 32$,

$\sqrt{H} = 6.4$, $H = 40.96$. In this case the height of the shaft would be practically 41 feet. By the same method the necessary height of shaft for any given area may be readily determined.

From an economical standpoint, other things being equal, it is far better to secure increased efficiency by increasing the size of the ventilating shaft rather than its height, for the obvious reason that the capacity of a shaft for removal of air increases directly with the increase in sectional area, whereas the velocity of the air current increases in direct ratio with the square roots of the heights of the shaft, thus requiring that the height of a shaft shall be quadrupled to double its efficiency while it is only necessary to double its sectional area to secure double efficiency. There is also a loss by increase of friction and of cooling surface, and in the disproportionate increase of expense of construction. The cost of increasing the efficiency of a shaft 100 per cent, by increasing the velocity of the air current, will be very much greater than in securing the same result by increasing its sectional area. Cases occur, of course, in which the stronger draught secured by increased height of shaft is essential to the efficient working of a ventilating system or the accomplishment of a specific purpose.

8. When possible to do so, it is unquestionably preferable to so plan a system of heating and ventilation that it will operate efficiently by the aid of natural draught only. Such a system is as nearly automatic in its action as any ventilating system can be made. A draught which depends upon a mechanical apparatus, as a pressure or suction fan, or even upon a steam-coil or other form of heating apparatus in the ventilating shaft, is very likely to be found defective when efficiency is most needed. I have visited many large institutions provided with large ventilating fans, and have never yet found one in which the apparatus was in constant operation. In many cases it had been inoperative for years, and was not in running order. In one case I was informed that

WINDOW PARTLY OPEN.

The Patentees have every confidence in calling the attention of Architects, Builders, Ironmongers and the trade generally to their new Patent Window Openers, as possessing advantages over all other Fanlight Openers in the market.

Working Models of the above and other Specialties may be seen at our new Showrooms, 57 HOLBORN VIADUCT, E.C. Architects and Builders are invited to inspect same.

the fan was started "whenever the odours in the ward became so strong as to be very noticeable." To my nose the odours were at that moment very strongly pronounced, and yet the fan was not in operation. The noses of managers and attendants become accustomed to odours to the presence of which they are constantly exposed, so that they cease to be a proper means of testing the condition of the air.

Some years ago the writer visited a large hospital, the air supply of which was wholly dependent upon a fan which was a pressure-blower, and hence so constructed that when the fan was not in operation the opening for the entrance of air through the fan was very small. The fan was placed in the mouth of a tunnel nearly 8 feet in diameter, just about the proper size for supplying air to the hospital at a moderate velocity, but the opening of the fan had a sectional area of only about 4 square feet. The hospital had been in operation for some three years. The fan had never been in operation since the opening day, as it was run by a separate engine, and was so far from the building as to require the attention of a special engineer when in use, and, consequently, the air-supply of the hospital, which was filled with sick people of all classes, was limited to the small opening described, there being no other. It is certainly unwise to so plan the ventilating system of a large building as to make the inmates absolutely dependent upon the efficient working of a mechanical apparatus of this sort. Mechanical and other means of assisting "natural draught" are, nevertheless, valuable, and in some instances necessary accessories to a system of natural ventilation, especially for large buildings, as they furnish a means by which the disturbing influence of winds may be more or less completely overcome. The writer has had two large fans in use in buildings under his care for several years, as occasion has required. As usually constructed and employed, however, these appliances are almost useless from their inadequacy and inefficiency. This is especially the case when heat in the ventilating shaft is depended upon as a means of securing a strong draught, in consequence of the use of an amount of heating surface quite inadequate for the work required.

Ventilating shafts which are exposed on all sides, and even those which are placed in the outer walls of buildings, must be heated or furnished with a fan to insure a constant draught. The amount of heating surface usually provided in such cases is ridiculously small, and is not infrequently so placed as to be of very little value. When it is recalled that all the air sup-

plied to a building must pass through the ventilating shaft, it will be apparent that a considerable amount of heat must be imparted to this air to produce a strong draught in case the chimney is so situated that the air loses a considerable amount of its heat before it is expelled from the chimney.

From experiments which have been made (Box) for the purpose of determining the heating capacity of steam-pipes, we know that 1 square foot of surface of 1-inch pipe (3 linear feet) will give off about 300 heat units per hour, or 5 heat units per minute under the conditions in which heating is required in a ventilating shaft. Five heat units will raise the temperature of 276 cubic feet of air 1 deg. (1 cubic foot of air at 62 deg. weighs '0761 lbs.). The specific heat of air is '238. $5 \div '0761 \div '238 = 276$. Knowing the amount of air to be transmitted by the ventilating shaft per minute or second, it is easy to determine the amount of heating surface required to raise the temperature of the air one or more degrees. It is only necessary to divide the amount of air transmitted per minute by 276 to determine the number of square feet of heating surface required to raise the temperature of the given quantity of air 1 deg. Fahr.

Taking, for example, a case in which, as in our last illustration, the amount of air required to be transmitted is 32 cubic feet per second, or 1,920 cubic feet of air per minute, we have $1,920 \div 276 = 6.95$, practically 7 square feet of heating-surface, or 21 linear feet of 1-inch pipe, necessary to raise the temperature of the air 1 deg. Fahr. To raise the temperature of the air 5 deg., which would be quite sufficient to insure the successful working of the shaft, would of course require five times as much heating surface, or 105 linear feet of 1-inch pipe.

The most economical method possible for heating a ventilating shaft is the combustion of fuel in the shaft itself. A number of years ago, in studying the ventilation of the Houses of Parliament in London, by the aid of the assistant engineer, who kindly conducted me through the subterranean region of this great structure, I was surprised to find that the current of air in the great towers, which are not merely architectural features but constitute the ventilating shafts of the building, was maintained by means of a great heap of burning coal, which was placed exactly in the centre of the shaft upon a high platform, the top of which was at about the same level as the top of the great horizontal ventilating ducts which entered the shaft at its bottom.

Fuel may be consumed in a shaft by means of a stove placed in a chimney, carrying the stove-pipe up through it. In exceptional cases the smoke may be discharged directly into

the shaft, but this arrangement is not always a safe one and hence cannot be recommended. The position of the heater is a matter of no small importance. I have sometimes seen a steam-coil placed at the extreme bottom of the ventilating shaft, the first opening being several feet above it. In so placing the heater there is very little circulation of air, and hence its efficient heating-capacity is not utilised. To secure the efficient working of a ventilating shaft, the heater should be placed above the highest opening. It is, as a rule, not wise to have openings into a ventilating shaft at different levels, but if this arrangement cannot be avoided the heater should certainly be placed above the highest opening; or if a long heater, placed against the side of a chimney, it should extend above the highest opening. Whether the heat should be concentrated near the lower portion of the shaft, or should be extended some distance along the inside wall, is a question which may be differently answered according to circumstances. There is an advantage in the extension of the heater some distance along the inner wall, in that a better opportunity is afforded for radiation and thus for heating the inner surface of the shaft, and so preventing the tendency to downward currents. It should be remembered, however, that the higher in the shaft the heater is placed the shorter will be the heated column, and hence, from this standpoint, the less the efficiency of the heat employed.

In conclusion, the writer wishes to disavow any attempt to make in the foregoing an extensive presentation on the subject of ventilation. Those who wish to make an extended study of the subject will find the means of doing so in the excellent work of Mr. Thomas Box, published by E. & F. N. Spon, 12 Cortlandt Street, New York City. My aim in the preparation of this paper has been to present such practical points as I have gathered from a somewhat extended experience in planning the ventilation of large buildings in which I have had an opportunity to live for a series of years, studying the result of various methods employed, and to formulate a few simple rules which are useful for the working-out of correct methods of ventilation in all ordinary cases, and which are much less cumbersome for use than the ponderous formulas of Box and others who have undertaken to present this subject in a scientific way. I ought also, perhaps, to call attention to the fact that, while the physical principles relating to heating, ventilating, &c., are correctly given by Box and other authors who have given much scientific data upon this subject, the suggestions made with reference to the supply of fresh air are,

as a rule, widely at variance with the conclusions at which Parkes, Angus Smith and other investigators have arrived in the study of the question of ventilation from a sanitary and hygienic standpoint, and so are not to be relied upon. For example, Box puts the amount of fresh air required for each person per hour at 212 cubic feet, which is simply ridiculous, being less than one-tenth the amount shown by ample experience to be really necessary.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 7577. Walter William Neal, for "Improvements in or relating to drain-pipes or the like."
- 7591. William Jones and Henry Jones, for "Improvements in fireproof tile ceilings, partitions and the like."
- 7635. William Youtlen, for "Improvements in casements and doors."
- 7655. Louis Spencer Flatau, for "Improvements in metallic roofing."
- 7679. Walter Wolfram and Paul Wolfram, for "Improvements in and relating to locks."
- 7689. Charles Breech, for "An improved drain junction and sockets for connecting drains with existing sewers."
- 7690. David Richmond, for "Improvements in and relating to syphons for water-closet and other cisterns."
- 7721. Thomas Dunsire and — Lawrie, for "Improvements in and relating to the securing of windows, doors, &c."
- 7862. William Henley, for "Improvements in window-blind fittings"
- 7908. Thomas Garforth Rhodes and Raymond Gaunt, for "Improvements in syphons for flushing cisterns, tanks, and the like."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

SUGG'S

PATENT HIGH-POWER

SUSPENSION GAS LIGHTS

90 to 600 Candle Power.

ADVANTAGES:—

(1) BRILLIANT, WHITE, SOFT LIGHT.

These lights are fitted with patent vertical flat-flame burners, which develop a much higher illuminating power than is obtainable with horizontal flames. They are also fitted with Opal Glass Reflectors.

(2) GREAT SAVING OF GAS.

The consumption is far less than under the old system.

(3) NO FLARING OR FLICKERING.

The burners are controlled by a patent Automatic Governor, and the flames are perfectly steady, being protected by the glass screen.

ADOPTED BY MANY LEADING ARCHITECTS.

SPECIALISTS IN GAS LIGHTING.

Private Gas Works erected in any part of the Kingdom.

THE Architect and Contract Reporter.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

COMPETITIONS OPEN.

LLANELLY.—May 15.—Elevations and Plans are invited for proposed School. Mr. Fred. Nelson Powell, Clerk to the Managers of the Llanelly Intermediate and Technical Schools, Llanelly.

CONTRACTS OPEN.

ABERDARE.—May 16.—For Building Twenty or more Houses at Rhid-y-Wain. Mr. John Morgan, Clive House, Trecynon, Aberdare. Mr. G. A. Treharne, Architect, Aberdare.

ABERAMAN.—May 20.—For Building Thirty or more Houses. Mr. G. A. Treharne, Architect, 5 Canon Street, Aberdare.

ABERSYCHAN.—May 11.—For Iron Girders, Masonry, &c. for Widening Bridge. Mr. E. Cooke, Council Offices, Abersychan.

ANDOVER.—May 10.—For Erecting Iron Fence, with Dwarf Wall. Mr. T. E. Longman, Town Clerk, Andover.

BARNES.—May 21.—For Erection of a Postmen's Sorting Office. Messrs. Hunt & Stewart, 45 Parliament Street, S.W.

BARROW-IN-FURNESS.—May 15.—For Supplying and Erecting Gasholder Lift. Manager, Gasworks, Barrow-in-Furness.

BARROW-ON-SOAR.—May 17.—For Sewerage Works in the Parish of Swithland. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

BARROWFORD.—May 20.—For Sewerage Works. Mr. J. T. Landless, Station Buildings, Nelson.

BASSENTHWAITE.—May 11.—For Building Dwelling-house. Mr. F. Waite, High Side, Bassenthwaite.

BECCLES.—May 11.—For Building Shops, &c. Secretary, Working Men's Co-operative Society, Limited, Newgate Street, Beccles.

BISHOP'S STORTFORD.—May 13.—For the Construction of a Reservoir Cooling Pond, Boundary Wall and Gates, the Construction of an Additional Well with Rising Main and Pump Fittings, and the Repair of Engine and Alterations and Additions to Engine-house. Surveyor, Council Offices, North Street, Bishop's Stortford.

BRIDGE-END.—May 27.—For Erection of Two Dwellings and Alterations at the Nash Lighthouses. Mr. C. A. Kent, Trinity House, London.

BRIGHTON.—May 10.—For the Construction of Two Concrete Groynes and a Sea-wall. Mr. Francis J. C. May, M.I.C.E., Town Hall, Brighton.

BRIGHTON.—May 14.—For Construction of Engine and Boiler Houses. Mr. F. J. Tillstone, Town Hall, Brighton.

BURY.—May 18.—For Forming Roads, Borough Engineer, Bank Street, Bury, Lancs.

CANTERBURY.—May 23.—For Supplying Road Materials. Mr. A. H. Campbell, 28 St. Margaret Street, Canterbury.

CLEETHORPES.—May 11.—For Erection of a Public Hall, Club-house and Four Shops. Mr. Wm. Brown, Bank Chambers, Cleethorpe Road, Great Grimsby.

CORTON.—May 13.—For Building Church Schools. Messrs. Bottle & Olley, 5 Queen Street, Great Yarmouth.

CROMER.—May 16.—For Construction of about 1,360 Yards of 12-inch and 9-inch Stoneware Pipe Sewers, with Manholes and other Works on Runton and adjoining Roads within the District; also for Kerbing and Making-up about 220 Yards of Runton Road (Widened Portion), and for Supplying and Fixing about 1,400 Yards of Granite Kerb on the adjoining Roads. Mr. A. F. Scott, Church Street, Cromer.

CULLOMPTON.—May 16.—For Rebuilding Bridge with Iron Girders. Mr. H. Michelmore, County Council Offices, Exeter.

EASINGWOLD.—May 17.—For Drainage Work at the Workhouse. Mr. F. J. H. Robinson, Guardians' Offices, Easingwold.

FRAMLINGHAM.—May 15.—For Laying Stoneware and Iron Pipe Sewers. Mr. T. Miller, 9 Thoroughfare, Ipswich.

FULHAM.—May 14.—For Erection of a Branch Post Office. Mr. A. Paull, 6 Quality Court, Chancery Lane, E.C.

GLOUCESTER.—May 21.—For Constructing Reservoir and Laying Cast-iron Pipes. Mr. Wm. Fox, 5 Victoria Street, Westminster.

GRAVESEND.—May 14.—For Erection of Municipal Offices. Mr. A. G. Smith, M.S.A., 1 Darnley Street, Gravesend.

GREAT BENTLEY.—May 23.—For Erection of Schools for 250 Children, Board-room, Masters' Residence, Boundary Walls, &c. Mr. J. W. Start, F.S.I., Colchester.

GRIFFITHSTOWN.—May 10.—For Building Infirmary. Mr. E. A. Lansdowne, Metropolitan Bank Chambers, Newport, Mon.

HAVANT.—May 11.—For Building Board School. Mr. A. E. Stallard, Architect, West Street, Havant.

HALIFAX.—May 11.—For Constructing Reservoir and Laying Earthenware and Cast-iron Pipes. Messrs. Horsfall & Williams, 15 George Street, Halifax.

KENSINGTON.—May 16.—For Enlarging Nurses' Home. Mr. T. W. Aldwinckle, 1 Victoria Street, Westminster.

KNOCKHOLT.—May 15.—For Building Police Station. Mr. F. W. Ruck, 86 Week Street, Maidstone.

LAMBETH.—May 16.—For Erection of a Large Shed with Corrugated Iron Roof. Mr. Henry J. Smith, Vestry Hall, Kennington.

LEWISHAM.—May 10.—For Boring at the Ladywell Baths. Mr. E. H. Oxenham, Local Board Offices, Catford.

LEYBURN.—May 16.—For Building Church Room. Mr. Wm. Bell, N.E.R. Station, Leyburn.

LISCARD.—May 27.—For Excavating and Forming a Lake in Central Park. Mr. A. Salmon, Public Offices, Egremont, Cheshire.

MANCHESTER.—May 13.—For Erection of Electric-light Machinery and Installation. Mr. T. de Courcy Meade, Town Hall, Manchester.

MANCHESTER.—May 16.—For Pointing Chimney-stacks and Walls at Workhouse. Messrs. W. T. Gunson & Son, 10 Marsden Street, Manchester.

MERTHYR-TYDFIL.—May 13.—For Erection of an Accident Ward at Hospital. Messrs. Wakeling & Mackay, Market Square Chambers, Merthyr-Tydfil.

MILE END.—May 23.—For Erection of New Laundry Machinery, New Engines, Steam Plant and General Engineer's Work in Connection with their New Steam Laundry, and Alterations and Additions to the Laundry and Boiler-house, at the Workhouse, all situate in Bancroft Road, London, E. Mr. C. F. Burden, Guardians' Office, Bancroft Road, E.

MOSS SIDE.—May 18.—For Building Board School and Caretaker's House. Messrs. Woodhouse & Willoughby, 100 King Street, Manchester.

MURTON COLLIERY.—May 13.—For Building Twenty Cottages. Mr. Robert Hogg, Fatterly Pasture, Murton Colliery.

RADCLIFFE.—May 15.—For Building School, &c. Mr. Edwin Grundy, 12 Brazenose Street, Manchester.

RAWDON.—May 13.—For Building Chemical Mixing-house and Concrete Precipitation Tanks and Laying Stoneware and Iron Pipe Sewers. Mr. W. H. Radford, Angel Row, Nottingham.

ROCHDALE.—May 10.—For Building Offices for the Guardians. Messrs. Rutworth & Duncan, Architects, South Parade, Rochdale.

RYTON.—May 13.—For Constructing Sewers, with Flushing Chambers, Ventilation Shafts, &c. Mr. J. P. Dalton, Urban District Council Offices, Ryton-on-Tyne.

SCARFSKERRY.—May 15.—For Constructing Concrete Pier. Mr. James Barrow, 166 Union Street, Aberdeen.

SHEFFIELD.—May 11.—For Building Dwelling-house. Mr. C. Hadfield, Old Club Chambers, Norfolk Street, Sheffield.

SPILSBY.—May 15.—For Supply of 7,000 Tons of Broken Granite and a like amount of Broken Slag. Mr. George Walker, Council Offices, Spilsby.

ST. MABYN.—May 11.—For Building Schools. Mr. John J. T. Andrew, St. Mabyn.

ST. MARYLEBONE.—May 16.—For Erection of a Shelter, &c., at the Parish Stoneyard. Mr. W. H. Garbutt, Court House, St. Marylebone.

ST. HELIERS.—May 10.—For Constructing Landing Stage. States Engineer's Office, Jersey.

STOCKPORT.—May 13.—For Constructing Brick Sewers. Mr. A. M. Fowler, 1 St. Peter's Square, Manchester.

SUFFOLK.—May 24.—For Sinking Two Wells, 6 Feet Diameter and about 25 Feet Deep, and Lining them with Cast-iron Cylinders, Putting Down a 6-inch Borehole in each Well to the Depth of 300 Feet from the Surface, Lined with Borehole Tubes, and Providing Temporary Pumping Plant and Proving the Yield of Water from each Borehole, together with all Pipes, Fittings and other Subsidiary Works, and Construction of Aeration and Filtration Works, consisting of Aerating and Subsidising Tank of a capacity of 50,000 Gallons, Three Sand Filter Beds, Covered Sterilised Water-tank of a Capacity of 50,000 Gallons and Sand-washer, together with all necessary Valves, Pipes and Connections. Messrs. Geo. & Fred. W. Hodson, Engineers, Loughborough.

SWINDON.—May 27.—For Erection of a School to accommodate 885 Children. Mr. W. Drew, Architect, Swindon.

NOTICE TO ALL WHOM IT MAY CONCERN.

ROBERT ADAMS, of the Building Trades Emporium, 67 Newington Causeway, London, S.E., Engineer, who was the Original Inventor and Patentee of the Fanlight and Skylight Openers known in the trade as the "SCOTT," and similar in construction to those called "Silens,"

Hereby Gives Notice that prior to the date of any application for a Patent to any other person, Mr. ADAMS manufactured and sold his original and genuine Fanlight and Skylight Openers, and has ever since continued and intends to do so, until replaced by his new and improved Patents.

Mr. ADAMS earnestly requests any customers who may be deterred from purchasing of him by any Notices contrary hereto, to at once communicate with him.

Also write Mr. ADAMS for particulars of his recently improved "Scott" and "Gem" Fanlight and Skylight Openers, he being the Inventor and Patentee of the largest number and most suitable variety of Fanlight and Skylight Openers for all classes of work.

The Advertiser takes all risk with regard to the above Advertisement.

THORNHILL.—May 10.—For Building Five Cottages. Mr. James C. Haller, Thornhill, Dewsbury.

TUNBRIDGE WELLS.—May 25.—For Erecting Dressing Boxes, &c., at the Open-air Baths. Mr. W. C. Cripps, Town Hall, Tunbridge Wells.

WALSALL.—May 14.—For Providing and Laying Asphalte. Mr. John R. Cooper, Town Clerk, Walsall.

WAR DEPARTMENT.—May 14.—For Painting, White-washing, &c., Internally and Externally Various Barracks and Buildings in Woolwich Royal Engineer District. Lieut.-Col. Orpen, R.E. Office, Woolwich.

WAR DEPARTMENT.—May 31.—For Engineer Station and Out-Station in the North-Western District, Liverpool. Major R. Thompson, R.E., Royal Engineer Office, Rupert Lane Barracks, Liverpool.

WEST HAM.—May 14.—For Two Beam Pumping-Engines, each about 250 Indicated Horse-power; Two Centrifugal Pumps and Engines, each about 350 Indicated Horse-power; Four Boilers, each 30 Feet in Length by 7 Feet 6 Inches in Diameter; also Alterations to Existing Centrifugal Pump, Engine and Boilers and Other Works. Mr. Lewis Angell, Town Hall, Stratford.

WESTMINSTER.—May 10.—For Rebuilding West Block of Workhouse. Messrs. J. Waldram & Son, 13 Buckingham Street, W.C.

WHITECHAPEL.—May.—For Internal Painting and Minor Structural Works at the Infirmary, Mile End Road. Mr. Capel, Union Offices, Baker's Row, E.

WYE.—May 11.—For Constructing Gasholders and Tank. Mr. W. Lewin, the Gas Company, Wye.

YSTRAD RHONDDA.—May 11.—For Building Church and Boundary Walls. Mr. E. M. Bruce Vaughan, Architect, Cardiff.

At the meeting of the Edinburgh Dean of Guild Court, of twenty-six applications seventeen were granted, warrants being issued to the Corporation, to construct a subway and access between Orwell Terrace and West Fountain Place; to Mr. James Anderson to erect a villa at the corner of Mayfield Road and Lygon Road, and to Mr. Alex. Wilson to erect semi-detached villas at Saville Terrace.

WINSOR & NEWTON'S

"Waterproof"

INDIAN INK.

This new preparation—made from genuine Indian Ink—has been introduced to meet the requirements of those Artists, Architects and Designers who wish to lay washes of colour over drawings in ink.

Unlike many so-called Indelible Inks, "Waterproof Indian Ink," when dry, will be found absolutely unaffected by subsequent wetting.

TRADE NOTES.

THE Eagle Foundry, Greenock, have secured a contract for the construction of a set of triple-expansion engines for a cargo steamer of about 8,000 tons capacity, to be built by Messrs. Russell & Co., Port Glasgow.

THE gas committee of the Bridgnorth Town Council submitted a recommendation at the quarterly meeting, which was approved, that more storage accommodation was an absolute necessity. The engineer recommended that the present large holder, having a capacity of 50,000 cubic feet, be superseded by a two-lift holder of 115,000 cubic feet capacity. There should be no delay in placing the contract, which would absorb a sum of about 1,800l.

AT the finance committee of the Liverpool Corporation there was read a letter from the churchwardens on the prompt and effective action of the City Council in connection with the maintenance, &c., of the church clocks. The report of the surveyor on this subject was approved, and he was instructed to carry out the necessary repairs to the clocks, and to arrange for the winding and keeping in order of the clocks. Evidently in the matter of clocks Liverpool is behind the age.

THE East Finchley Board Schools are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

BUILDING AND BUILDERS.

THE fund for the restoration of Walsall Hospital has reached 2,222l, and the committee have adopted plans for the rebuilding of the damaged portions of it and the addition of a medical ward, the capacity of which will depend upon the amount of money received.

A MEETING of master builders representing associations from the principal towns of Scotland has been held in Edinburgh, for the purpose of considering the advisableness of

forming a Scottish federation of the building trades. The proposal to form a federation was agreed to, and a committee was appointed to draft articles of association.

THE Glasgow Police Board by a large majority have adopted the recommendation of the finance committee to sell a plot of ground in Townmill Road at the restricted price of 5s. per square yard to the City Improvement Trustees for the proposed purpose of erecting workmen's dwellings.

BUILDING operations for a new church at Southport will shortly commence under the superintendence of Messrs. Preston & Vaughan, of Manchester, whose designs were selected in competition. The total cost is estimated at about 20,000l.

ELECTRICAL.

At the meeting of the Worcester City Council it was determined by a majority of two to reduce the salary of the city engineer, Mr. T. Caink, from 450l. a year to 400l. a year, in consequence of the appointment of an electrical engineer, who will relieve Mr. Caink of certain duties in connection with the installation of the electric light in the city.

Harper's Weekly for April 20 gives an account of a new electric railway which is about to open in Chicago. It has a capital of 2,400,000l.; a total length completed, including branches, of 13½ miles; on the main line there are four lines of rails, the continuing and subsiding lines having two lines or "tracks"; the trains are to run at "express" speed, 15 miles an hour; and trains will be run at half-minute intervals. The Chicago River is crossed by "two double-track rolling-lift bridges, which can be opened or closed in 15 seconds," two bridges being used, so as not to delay the traffic in case there should be an accident to one of them. The plan adopted is that of the Liverpool electric overhead line, which is run on the trolley system, with a third rail instead of the usual wire overhead. The "power-house," where the electric motive power is generated, contains "four Aldis engines, two of 1,500 horse-power and two of 3,100 horse-power, together with four generators, two of 670 kilowatts and two of 1,370 kilowatts. A kilowatt represents 1,000 watts, a watt

being the practical unit of electrical activity or power. As there are 746 watts in one horse-power, these generators are by the ordinary method of measurement respectively 898 horse-power and 1,836 horse-power. The road has been constructed in the most substantial manner, and is built entirely of basic open-hearth steel. The material was forged and fashioned by the Carnegie Steel Company of Pittsburg, and that company also erected the structure. The passenger cars were built by the Pullman Car Company, and are similar to those used on the elevated roads of New York. The motor cars, built by the Barney Smith Company, are as large as the passenger cars, and are to be used as smokers. The immediate construction of the road has been under the supervision of E. W. Ekert, general manager and chief engineer." A remarkable feature of the enterprise is that the company has not asked for any concessions from the municipal authorities, excepting permission to cross certain thoroughfares. All the land required has been bought privately, at a cost of about 1,400,000l.; an expenditure due to the fact that the line runs for some distance over the principal business part of Chicago, generally through a well-built district. "Six and a half million dollars," says *Harper's*, "for a right of way seems a very steep price, but it really is not so when it is considered that most of the land has been acquired in fee-simple, and that much of it was very highly improved. Some of the structures on the land purchased were handsome apartment houses, costly and quite new. It seemed out of the question to pull these down, so sites were purchased for them, and they were moved off to new locations. One of these, the Normandy flats, was the largest stone house ever moved from its original foundations, and this was taken to another street, several hundred yards away, without any of its walls being in the least cracked or damaged. All of the houses worth moving were so carried off, and the others were demolished."

A NEW and well-written series of articles entitled "Practical Telephony" is now appearing weekly in the columns of our penny contemporary *Electricity*. It is being written by Messrs. James Bell, A.I.E.E., and S. Wilson, and should interest a very large number of readers, especially in view of the inquiry now being held by the Government.

VARIETIES.

WE must not always expect to find accuracy in the descriptions of building construction in the newspapers. But the errors may sometimes give rise to much injustice. In the account of the late fire at a biscuit factory at Limehouse it was stated that the building was constructed on fireproof principles. That would mean that iron or steel beams and concrete were employed. But the fact was that the strongest fire-resisting material on the premises was timber; the floors were carried on wood joists, and it is no wonder they succumbed. As injury might be done to a most important industry we have considered it our duty to state the facts, and we repeat that the Limehouse fire is no evidence against the advantages of a system of fireproof construction.

THE Improvement Committee of the Longton Town Council have received the sanction of the Local Government Board to the borrowing of 8,000*l.* for the purchase of land for the purposes of street improvement in Market Street.

THE Argyll County Council has resolved to apply to the Secretary for Scotland for a grant in aid of the construction of roads in the more necessitous districts of the county. It was also agreed to proceed with the construction of the proposed pier at Craignish, for which a Government grant of 1,000*l.* has been promised.

IT is proposed to construct a light railway through the Fylde district, a great portion of which is six miles distant from any railway station. A committee has been appointed to consider the project.

THE death is announced of Sir George Buchanan, for long the chief medical officer to the Local Government Board.

AT the quarterly meeting of the Hereford Town Council it was decided to obtain a loan of 2,456*l.* to repair the breakages in the water mains caused by the late frost.

THE Great North of Scotland Railway Bill, asking running powers over the Highland Railway from Elgin to Inverness, is expected to be taken by the parliamentary committee towards the end of the present week.

AT the monthly meeting of the lower ward committee of the Lanarkshire County Council a statement of the expenditure for the year in connection with the highways and public health was submitted. It showed that for 1894-5 there was expended on highways 9,387*l.* 19*s.* 1*d.*, as compared with 11,642*l.* 10*s.* 10*d.* in the previous year, and on public health 2,891*l.* 17*s.* 3*d.* last year, as compared with 2,708*l.* 11*s.* in the previous year. The capital expenditure was 6,259*l.* 7*s.* last year, as compared with 4,209*l.* 15*s.* 11*d.* in the preceding year.

THE Secretaryship of Her Majesty's Office of Works and Public Buildings is about to become vacant by the promotion of Mr. Primrose.

AT the monthly meeting of the Darwen Town Council Mr. Duxbury, chairman of the water committee, announced a loss of 379*l.* 11*s.* 5*d.* on the working of the department during the year. Mr. Eccles reported upon the progress of the reconstruction scheme. He said that they had over-expended their borrowing powers by 6,000*l.*, and the committee proposed to ask the Council to sanction borrowing powers for 8,000*l.* additional. They intended at some time to erect fifty artisans' dwellings at a cost of 12,000*l.* Councillor Davies said that there was a net profit on the year's working of the gas department of 3,729*l.* 15*s.* 7*d.* He intimated that there would be an early reduction in the price of gas.

THE Surveyors' Institution meet on Monday, the 13th inst., when a paper will be read by Mr. R. E. Middleton, entitled "Village Water Supplies." The annual dinner of the Institution will take place at the Holborn Restaurant (Venetian Room) on Monday, May 27, at half-past six o'clock.

M. EUGENE BELLANGE, painter of the Third Empire, and son of a more eminent artist, died on Tuesday. He was born at Rouen in 1835.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

AT the ordinary meeting on May 2, Mr. Walter Beer, C.E., read a paper on "The Construction of Railway Bridges under 100 Feet Span." He advocated the working out of a set of standard girders for spans starting from 15 feet to the limit previously mentioned, advancing by increments of 5 feet, as he

believed that the present weight of locomotives and rolling stock had reached the extreme limit. He entered into the methods of calculating the strength of the various parts of girders, and drew attention to the necessity for care in the arrangement of the parts, so as not only to give ample strength to them, but to allow of their easy construction and of accessibility to all the parts for the purpose of painting. The author also gave examples and particulars of the cross girders as well as of the main, and pointed out the necessity of properly bedding the girders on their abutments, and the effect of placing the girders at an angle with the plates on which they rested.

A good discussion followed the paper, and among those who took part therein were the following:—C. T. Walrond, A. W. Ackermann, E. H. G. Brewster, W. Cooper Penn, J. Nealor Cooper, H. Williams, John W. Kitchin, Harold Cooper and A. F. Barnham.

THE WORKS DEPARTMENT OF THE COUNTY COUNCIL.

IN reply to the statement of the manager of the Works Department of the London County Council contained in a report of the Works Committee, the architect of the Council has drawn up a reply. Mr Blashell contends he has only been obeying the express wishes of the Council in insisting upon the best quality of works and materials in the undertakings carried out for the Council. The manager cannot, he thinks, have been officially aware of the excessive pressure which was in the earlier days of the Council put upon the architect's department to exact the best quality of materials and workmanship from every one over whom the architect had influence. All the specifications had to be prepared with a view to the work being carried out, if necessary, by contractors, and had to be written in the language ordinarily used where thoroughly good work was needed. It therefore followed that when these specifications were put into the hands of the Works Department they were expected to carry out the work on similar lines. The architect sees no reason for differing from the statement as to the relations between the workmen and the members of the committee, but is of opinion that more importance might have been attached to the circumstances under which the department was hastily called into being. Much of its earlier work was necessarily experimental; therefore it was a mistake to entrust the whole of the business to them.

PROTECTION FROM FIRE.

SOME remarkable experiments have been carried out at the Germiston Works of the Arrol's Bridge and Roof Company, Limited, Glasgow. The Boyd-Wilson's patent fire-resisting floors and plaster partitions, and also the ordinary concrete and coke-breeze concrete fireproof flooring, were put to some extraordinary tests, and went through the ordeal by fire, water, and crushing pressure successfully. Experts, and among them architects and engineers and others distinguished by connection with and knowledge of building and engineering matters, were present, but of the description of the several tests now before us we may quote two or three which will be quite sufficient to give our readers information.

First, as to Wilson's patent fire-resisting floors, &c. A portion of a section representing a finished warehouse floor of 6-inch rough concrete, and 1½-inch granite finish, was placed on a furnace with the blast turned full on for one hour and ten minutes, over a heat sufficient to consume and burn away malleable iron, and throughout this test the upper surface remained cool. The flooring was then removed, the under side turned up, and instantly, while in that heated state, was thoroughly drenched with cold water. There was not the slightest sign of flying or disintegration of any kind. About three-eighths of an inch only of the under side was affected by the water, and this in a short time hardened up again. The slab, which measured 30 inches by 9 inches by 7½ inches, was then placed on bearings 2 feet 6 inches apart, and broke when subjected to a centre load of 4,060 lbs., and was crushed at a pressure of 1,500 lbs. per square inch.

Secondly, as ordinary concrete. A sample of the very best made ordinary concrete fireproof flooring, measuring 30 inches by 26 inches by 7 inches, composed of four parts of broken bricks, one part of sand, and one part of Portland cement, was tested for strength on bearings 2 feet apart, with a centre load of only 37 cwts. It was thereafter placed on the furnace, and the full blast allowed to act upon it for thirty-seven minutes, when small particles of water were seen being forced through and condensed on the top surface, thus showing that the heat was quickly penetrating the entire mass. It was submitted to exactly the same tests as Boyd-Wilson's patent flooring, but with very different results. It did not fly or disintegrate, but when subjected to the comparatively light weight of 25 cwts. in the centre it broke instantly, and it was perceived that the

heat had penetrated to within 2 inches of the top surface. The top was also found to be hot at this stage.

Thirdly, as coke-breeze concrete flooring. A similar test was applied to the coke-breeze or char concrete. The portion in this case submitted to the furnace measured 30 inches by 26 inches by 8 inches, and was composed of four parts of the best char or coke, as used in smith-work, and one part of Portland cement, with finished coat on top, composed of two parts

MARINE HOTEL, BEXHILL-ON-SEA.

ON the 27th ult. that rapidly rising seaside resort Bexhill-on-Sea was *en fête* on the occasion of the visit of the Lord Mayor and the opening of the new Marine Hotel, a commodious, hostelry conspicuously and pleasantly situated on the sea front. It is a stone building, and, as the illustration shows, of attractive elevation, erected by Mr. Cole, succeeded by Mr. Webb, from

crushed granite and one part Portland cement, and skimmed on the under side with neat Portland cement. It was submitted to the full blast of a similar heat for twenty-eight minutes, during which time tiny jets of smoke were seen to issue through the top coating, showing that the mass was rapidly being reduced to a red heat. When it was removed from the fire the under surface was a glowing red mass. It was not fused or vitrified in any way, but it was seen to be red-hot to a considerable depth. After the water test a centre load of 25 cwts. was applied, when it instantly gave way. The upper surface was found to be hot.

designs by Mr. J. B. Wall, architect, of Bexhill. Its interior arrangement leaves nothing to desire; it contains some forty bright, cheerful bedrooms, capable of accommodating about fifty guests, the spacious public rooms are handsomely appointed, and the whole was furnished in admirable taste by Messrs. Oetzmann & Co.

A CHURCH, to be called St. Margaret's, is about to be built in Abel Street, a rapidly growing district of Burnley. It will seat 560 people, and the estimated cost is 5,000l.

SOCIETY OF ENGINEERS.

A MEETING of the Society of Engineers was held on Monday evening, Mr. Wm. George Peirce, president, in the chair, when a paper was read by Mr. Charles Mason, surveyor to the Vestry of St. Martin-in-the-Fields, Westminster, on

Street Subways for Large Towns.

Mr. Mason said: The importance of an improved method of underground subway construction, although an old subject for casual discussions, has, the author believes, never been brought in a practical manner before a body of engineers. Although many reports have been prepared by municipal engineers, evidence given and Parliamentary powers obtained for the construction of subways for the reception of mains beneath the streets of our large towns, little has been done, and the subject is still one that should have the serious consideration of the engineers to our public authorities, gas, water, electric light and other companies.

Necessity for Subways.—The old-fashioned method of laying underground pipes is such that a periodical inspection of the mains for ascertaining their condition or for stopping leakages is almost impossible. Especially is this the case with our gas and electric mains, and the recent explosions in several parts of the Metropolis have imposed a duty upon those having the control of our streets to devise some better system, whereby material laid under ground of whatever nature can be easily examined from time to time. The construction of subways is the most satisfactory and in fact the only method for laying pipes and mains so that these conditions can be complied with.

The necessity for subways is also brought daily to our notice by the ruthless manner in which the street pavements are continually being disturbed in order to lay new mains, repair leakages, and for other purposes that are necessarily of almost daily occurrence. For those responsible for the maintenance of the pavements nothing can be more disheartening than, after having spent a large amount of time, energy, thought and money in designing and executing as far as possible a perfect pavement, to see the whole pulled up and practically ruined within perhaps a few days of the pavement having been laid.

Present Underground Arrangements Unsatisfactory.—In fact nothing could well be more unsatisfactory than the present system, although the author is free to admit that any remedy is attended with many difficulties unknown to the ordinary observer. It is now almost an axiom in building

that "no pipe must be out of sight," and anyone erecting a house and burying the supply or waste pipes in brickwork or plaster, or by other means making them inaccessible, is looked upon somewhat as a "jerry builder." The same law should apply to the streets, for what is lost to the householder in case of a desired examination for an escape is also lost to the rate-payers in examining an underground main. Undetected leakages may also, and often do, exist for long periods, someone suffering thereby, as for example:—

1. The householder in the case of a leakage from the water main percolating into his basement.
2. The water company from loss of water.
3. The gas company losing gas, as the condition of the subsoil of our streets fully proves.
4. The public generally from risks incurred in using the streets.

Interference with Street Surfaces.—Examinations for leakages are the main cause of disturbance in the pavements, these being generally made in a haphazard kind of way, as it is somewhat a matter of guesswork to define the exact spot requiring attention. In a recent examination in the Strand near Charing Cross an irregular area of about 19 square yards was displaced by an electric-light company before discovering the leakage for which a search was being made. Had the exact spot been known, the whole could have been repaired with less than one yard superficial of the road having been disturbed. This one leakage cost at least 14*l.* to discover, apart from the cost of the actual repairs to the electric conductor. Again, in order to find a leakage from one of the water mains, no less than six trials were made, lasting over a period of more than one month, and costing the company 25*l.*, irrespective of any repairs to the main. In addition to this expense to the owners of the several mains, the pavements are irretrievably damaged, and the life of the same materially shortened. The author has no hesitation in stating that the repaving of the Strand in 1893 would not have been necessitated for at least another year or two had it not been for the many disturbances it had been subjected to.

No Recognised System of Laying Pipes.—By the present system pipes are laid on the "first come, first served" principle; plans are submitted to the local authorities showing the proposed route and duly approved. When the ground is opened, however, it is often found that other pipes are in the way, consequently detours have to be made, and the author has known instances in a street containing many pipes where mains

have to be "looped" from point to point. Dead or disused pipes also exist in the streets in many cases, which should be taken out, as a foreign company may not interfere with them, consequently they become as much a block underground as the live pipes; they moreover serve as conductors for gas in case of leakages, thereby considerably increasing the risk of explosions.

Acts of Parliament.—Powers to construct subways are now generally included in local Acts for street improvements, special clauses being introduced for enforcing their use by those for whom they are constructed. It was found in the case of the Holborn Viaduct and the Southwark Street subways that the first Acts did not contain this proviso.

Company's Present Powers.—The powers granted to the various companies by Parliament give them authority to—

1. Break up and lay mains under streets.
2. Open up for repairs, and for
3. Constructing distributing boxes, &c.

All subject to due notice (except in case of emergency) being given to the authorities.

By-laws.—Under the London County Council Subways Act, 1893, the Council is empowered to make by-laws for the regulation of those using the subways. These by-laws contain stipulations as to access, time of entering, fees for entering, rental, &c., which are not altogether favourably received by the companies. It is, however, absolutely necessary to have regulations, and any one control over different interests is generally looked upon as arbitrary.

Municipalities lose Control of the Streets.—It will be seen that under existing arrangements the control of the London streets is far from being, as is generally supposed, entirely in the hands of the local authority; if the various companies were under one control the local authorities would certainly be in a better position to cope with the many difficulties they now experience.

Early Subways.—The earliest subways constructed in London are those in Southwark Street and Garrick Street, which were made about the year 1862. The first provincial town to adopt the principle was Nottingham, one having been constructed there in Victoria Street in 1863 from the designs of the late Mr. Marriot O. Tarbotton, a former member of this Society. The granite pavement in this street was not interfered with in any way for the first twenty-five years of the subway's existence. This fact speaks for itself as to the value of an underground construction.

Subways have also been constructed in connection with most of the metropolitan improvements, as in the case of the Holborn Viaduct, Thames Embankment, Charing Cross Road, &c., and the principle is now being generally adopted by the County Council in all their street improvements.

London Subways.—The London subways are, however, in the author's opinion, too small, and should be made to embrace the greater part of the width of the street. The Charing Cross Road subway illustrates the author's meaning. This subway is 11 feet 6 inches wide by 6 feet 6 inches high, with laterals or sideways placed from 30 feet to 60 feet apart, and will not conveniently hold the number of pipes that should be laid therein. An insufficient number of laterals or sideways are also provided, many of the supply mains having to pass out of a lateral and then down the footway to their destination. Difficulty is also experienced in crossing the subway with branches from the main pipes, as in the case of a gas main, being placed on one side of the subway where the branch for supplying the opposite side of the street has to be taken over the subway immediately underneath the soffit of the arch, thus obstructing the passage way, besides tending to form in the bends of the pipes accumulations of water, &c. The provision of longitudinal sideways for service supplies as suggested in the author's proposals is a means of preventing this crossing of the subway by branch pipes.

Provincial Subways.—Through the courtesy of Mr. Arthur Brown, the borough engineer of Nottingham, the author is able to show details of the subways constructed in that town in 1887 at the time the author was the assistant engineer to the Corporation. These subways are similar in general arrangement to those in the metropolis, but vary in size and have more laterals or sideways. In this case, moreover, vaults were constructed beneath the footway, and being the property of the Corporation were leased to adjoining owners, thus giving some return to the Corporation for the outlay.

The subway is 10 feet wide by 6 feet 6 inches high, and is provided with ventilation by means of open gratings overhead. The sideways or laterals are 4 feet high by 3 feet 6 inches wide, spaced 40 feet apart, and so arranged as to carry the pipes and drains to and from two properties. The vaults under the footways are 9 feet 3 inches wide by 7 feet high, and are readily leased to adjoining owners at a rental equal to 5 per cent. on the cost of their construction.

The subways adopted in the metropolis as well as those in Nottingham, although being a step in the right direction, do

not in the author's opinion meet the case as fully as is necessary. Considerable difficulty is experienced by the several companies possessing pipes therein in connecting from the subway to the premises to be supplied, and it is found that this construction, although minimising to a very great extent the breaking up of the street surfaces, does not, especially in London, entirely obviate it.

Difficulties of Construction.—The author is fully alive to the difficulties of designing a subway that shall be satisfactory to all parties concerned, and he is of opinion, as before stated, that most of the subways already constructed are open to several objections.

The Author's Proposals—The main points for consideration in designing a subway are:—

1. The number and size of mains likely to be laid therein (present and future).
2. Ample space for workmen.
3. Pipes to be so placed as to allow facilities for repairs, connections, &c.
4. Provision for sewer inspection and ventilation.
5. Light and ventilation to the subway.
6. Service pipes not to cross the subway.
7. Gas and water pipes to be laid with a fall.
8. Overhead construction to be water-tight.
9. Provision for street gullies, lamps, fire-hydrants and water-posts.

To meet these requirements the author has designed a subway suitable for the busiest thoroughfares of large towns, adapted for a street 50 feet wide. The principle is a triple subway having a central avenue for the trunk mains and sewer, and subsidiary or supply subways on either side for the smaller pipes, from which are taken the house connections. The central avenue is 10 feet wide by 6 feet 3 inches high, with a segmental arch over, the subsidiary subways being 6 feet wide by 6 feet high. The whole is constructed in cement concrete, with brick arches and glazed brick facings throughout. Vaults are provided beneath the footways which should be the property of the authority and leased to adjoining occupiers. The author makes a strong point of this, as in many cases the fact of the vault construction being private property prevents the public authority from making satisfactory repairs to the foot-path. A tramway is provided in the central subway for carrying materials. The public sewer is placed beneath with manholes at stated intervals, the house drains passing from the inspection "areas" in the vaults to the sewer in the ordinary manner.

Gullies are provided in the floor of the subway to receive the washings of same and in case the water mains require emptying.

The street gullies are placed over the spandrels formed by the vault construction, piers being built for encasing them where necessary. The outlets from these gullies are carried down through the subway construction into the sewer, and are also carried up to the footway pavement for inspection and cleansing. An asphalted damp course is laid over the arching, outlets for the drainage thereof being provided at intervals in the springing and connected therefrom to the sewer below.

The sideways are approached from the central way by arched openings 4 feet wide in the division walls. The whole construction is covered with concrete floated to the contour of the roadway to receive the paving. Light and ventilation are procured by means of overhead gratings opening into the roadway, and special openings for this purpose are provided at regular intervals, being adapted as street refuges. The sewers must not be ventilated into the subway; special means are provided for this by pipes taken from the sewer and carried up the adjoining buildings or connected with the external air independently of the subway.

Street lamps and water posts are fixed on the footways over the spandrels of horizontal arches, stoneware pipes being built in from the bases of same to the subsidiary subways for the reception of the gas and water supplies which can be drawn through these pipes when repairs or renovations are required. The large trunk mains rest upon sleeper walls, and the smaller ones are carried upon brackets built into the wall or attached to the overhead arching; these latter carry the telegraph, telephone and lighter wires. All the pipes are placed at a distance from the walls so as to allow for junctions, valves and connections; special passages or chases about 12 inches by 9 inches are left through the vault walls for passing through the services; these passages can be closed by suitable blocks or other means at each end.

Street fire hydrants must be placed in position similarly to the lamp columns, it being essential for them to be readily accessible from the road surfaces. Should it be necessary and desirable to construct electric transformer chambers for the high-tension cables, these can be placed in arched openings in the division walls of the subway, but in the author's opinion all transformers should be entirely upon the property of the company owning the same.

Special entrances are to be constructed for the reception of

pipes and other materials, and these can be arranged where side streets and courts abut upon the main street in which the subway is placed.

Cost of Construction.—The author does not advocate the principle of constructing subways in all existing streets, as he is well aware that it would be almost an impossibility for financial reasons as well as from interfering with the central traffic during the subway construction. He, however, is strongly of opinion that this form of subway, or a modification thereof, should be constructed in all new streets and in cases of street improvements, and in fact wherever a suitable opportunity for their introduction arises. The author estimates the cost of construction, exclusive of the street pavement and sewer, at 80*l.* per yard run of street, and he submits the following estimate of expenditure and receipts for the working thereof for a street 600 yards in length :—

Cost of subways : 600 yards at 80*l.* = 48,000*l.*

This amount could be borrowed at 3 per cent. for (say) fifty years : the annual expenses will therefore be—

Expenditure—

	£	s.	d.
48,000 <i>l.</i> at 3 per cent. for fifty years' annual repayment of principal and interest	1,694	8	0
Annual repairs and supervision (say) 1½ per cent.	720	0	0
	£2,414	8	0

Receipts—

300 vaults, spaced 4 yards apart on either side of street, at 7 <i>l.</i> 10 <i>s.</i>	2,250	0	0
Saving in cost of repaving—original costing 3,000 <i>l.</i> ; the life of same increased by the subway from four to five years	150	0	0
Ditto in sewer examinations and gully connections	20	0	0
* Annual rentals for mains in subway (say)	200	0	0
	£2,620	0	0
Estimated annual saving	£205	12	0

* The actual cost of street disturbance for five years in one of the London streets (600 yards in length) amounted to a yearly sum of 243*l.*

This estimate shows a balance in favour of subways, mainly on account of the vault rentals. Exception may be taken to this, but the author maintains that the whole of the street and subsoil thereof should be vested in the public authority, and in all applications to Parliament for new streets a clause to this effect should be embodied. The cost of the subway is almost prohibitively high, but the author brings the figures as well as the facts forward in order to show the chief difficulty experienced by local authorities in subway adoption, viz. that of cost. However it is impossible to place on the credit side in actual figures the enormous saving which would no doubt accrue were the streets to be kept free from obstructions necessitated by the present disturbance of the pavements. Accidents occur almost daily in some parts of the metropolis from this cause which never come to the knowledge of the local authorities, and there is no doubt that many hundreds of pounds are annually lost in horseflesh, rolling stock and through personal accidents to those using our streets for the ordinary business of life.

Subways in Old Streets.—Another serious difficulty occurs in adopting subways in old streets, viz. the question of taking up existing mains and relaying them in the subway; the companies would no doubt object to having their systems interfered with at their own expense, and a considerable additional outlay would be incurred by the Local Authority were the cost of this to be placed on them. The single subways as in Nottingham cost from 35*l.* per yard lineal, and these are very well adapted for provincial towns where the underground system of pipes is not so extensive as in London, but the same difficulties arise from the fact of the subways not being in duplicate so as to dispense with the necessity for crossing the subway with the supplies.

The London County Council have a scale of charges fixed at a lump sum per subway for each size of pipes, in addition to which fees are taken for time in laying or repairing pipes, and for opening and closing the subway. The author recommends abolishing all fees, and making the annual rentals inclusive, thereby reducing the number of objections raised by the companies to the present system.

It should further be mentioned that subways will effect a considerable saving in the cost of roadway maintenance and repairs to the pipes in cases of severe frost when the water in the mains becomes frozen (as in the past winter), and subsequent leakages occur. The temperature of the Nottingham subways was found to have a range of only 5 deg. against a

OPTIMUS SUPERIOR PHOTOGRAPHIC OUTFITS.

EXTRA LONG FOCUS CAMERA.

British Journal of Photography says:—"The present model Rayment Camera is among the very lightest of actually rigid cameras offered to the public. The rapidity of opening and closing is greatly facilitated by the additional arrangement for throwing the pinion out of gear from the rack. There is no curtailment of view when lenses of short focus and wide angular aperture are in use. All movements necessary to the modern scientific photographer are included in this compact instrument."

range of 34·2 deg. in the outside air, the lowest reading in the subway during the winter of 1890-91 being 40·7 deg. as against 19·2 deg. outside, the highest in the subway being 45·8 deg. and the highest outside 53·4 deg., thus proving immunity from risks of frozen pipes.

Inspection and Supervision.—A permanent inspector should be appointed for the supervision of all subways, such inspector to be the servant of the local authority. His duty would be to see that everything was in order, and that none but those possessing proper passes were admitted. Those renting the subway should be at liberty to enter as and when they please, without having to waste time in procuring keys and giving notices as at present.

Generally.—A strong point in favour of subways is that of wear through rust in the iron pipes when laid in the ground, and which frequently becomes a serious question. Iron pipes in subways when properly coated should have almost an everlasting life.

The author's experience having chiefly been in built-up areas, it must not be inferred that he advocates the construction of expensive subways in suburban districts, but only where the traffic is so enormous and the interests of adjoining owners so great should the principle be adopted. But it is (and this is a most serious objection to their construction) necessary in busy thoroughfares to stop all traffic and interfere materially with the supplies of gas, water, electricity, &c., during their construction.

The author has accepted, without comment, the principle of the municipalities owning the subways, as it would be unwise for each company to construct its own subway, besides being prohibitive on account of the cost, which would be proportionately greater and fall directly on the companies. The whole should be constructed by the municipality, under their own control, maintained by them and leased to the companies. This is not the time or place to discuss the complex problem of municipalising the public companies, but there is no doubt such a course, from a municipal point of view, would cause less inconvenience to the public using the streets.

In conclusion, the author feels that he has introduced a very controversial subject, but one the importance of which is universally recognised; the form of subway proposed can only be adopted in central districts of large towns having valuable frontages, but some cheaper form of the triple system could well be (and should be) introduced in those districts unable to bear so heavy a cost as the subway devised by

the author. The initial difficulty is the question of cost, and the best way to overcome this is for the local authority to own the subsoil of the roads and lease the vaults constructed therein.

THE INSTITUTION OF JUNIOR ENGINEERS.

At a meeting of this Institution held at the Westminster Palace Hotel, London, on May 3, the chairman, Mr. H. J. Young, presiding, papers on "The Warming of Buildings by Hot Water" were read by Mr. Ernest King, Wh.Ex., and Mr. Kenneth Gray, members.

The subject was treated in two divisions, the first dealing with the low-pressure system and the other with that of the high-pressure. The authors having stated the theory of circulation and mode of determining the motive force in a hot-water apparatus, proceeded to deduce therefrom the best arrangement of the mains and pipes. The extent and size of piping to maintain suitable uniform temperatures in various buildings were then considered, and different forms of boilers reviewed, their particular advantages being fully discussed. It was shown to be often a matter of economy to employ a boiler somewhat larger than actually necessary. The several parts of the apparatus were described in detail, attention being called to the important improvement in hot-water engineering by the introduction of the ornamental radiator used for ventilating as well as for heating purposes. In referring to valves, those with full waterway were specially advocated. Passing on to the high-pressure system, its leading characteristics were brought forward, special mention being made of the pipe-joints, boiler coil and pipes, and the various ways of circulation. The relative merits of the low and high pressure systems were investigated, from which it appeared that the former was more advantageous, being initially cheaper, safer, more economical to work and capable of readier and more effectual control.

The papers were illustrated by a very large number of diagrams, specimens, &c., and an interesting discussion followed, in which Messrs. E. Berry, H. Parsons, Z. King, F.R.I.B.A., P. Griffiths, Loftus Perkins, W. B. Clarke, W. G. Walker, Shephard, A. S. Arundel, H. E. Duncan and B. T. King took part. A visit will be made on Saturday, May 18, to the Imperial Institute to inspect its heating system and other engineering features.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.

ON Monday evening, in one of the classrooms, the students of the architectural and building classes, conducted by Mr. Charles Gourlay, to the number of over one hundred, took advantage of the opportunity of his appointment to a professorship of architecture and building construction in the college to present him with a token of their great regard for him as a teacher and a friend. This took the form of a very handsome oak writing cabinet. Mr. Isaac Low, an old student of the college, presided, and Mr. James Lockhead, the instructor in the architectural studio, made the presentation, referring to Mr. Gourlay's qualities as a conscientious and painstaking teacher, and to his genial and likeable manner as a friend. Mr. Gourlay, in reply, expressed his deep sense of their kindness, and, speaking of the future of his classes, indicated his determination to make them still more successful. Other gentlemen from the various classes also spoke, and the meeting, which was a most enthusiastic one, closed with a vote of thanks to those who had made the arrangements.

SUB-CONTRACTING IN AMERICA.

THE Master Builders' Association of the City of Boston have adopted the following rules for defining the rights and obligations of principal and sub-contractors for building work.

Article 1. Obligation of Principal Contractor to Sub-Contractor.—A principal contractor is under obligation to treat upon an equal basis all estimates which he "receives" prior to putting in his own bid. Estimates must be considered as "received" when they come into a principal contractor's possession, either by his direct solicitation or by being accepted by him. The opening of a bid, knowing it to be such, constitutes receipt of the same.

A principal contractor is under no obligation to use a bid which he has not solicited, accepted or received, but if he does not wish to use the estimate of a sub-bidder he should decline it if proffered personally, or should return it unopened if sent to him by mail or otherwise. The retention of a bid should be construed as a receipt of the same.

All bids should be considered "confidential," and a principal contractor revealing any bid received by him to any

person whomsoever, without consent of the sub-bidder, will be liable to complaint and discipline under Article 10 of the by-laws of this Association.

A principal contractor, when making up his estimate, is not entitled to receive bids from sub-contractors if he is at the same time making himself their competitor by figuring their portion of the contemplated work. It is legitimate for a principal contractor to figure all portions of work, depending upon no one for what are usually known as sub-estimates, but it is not legitimate for him to receive bids from others for sub-work if he is himself figuring those portions independently.

Article 2. Award of Sub-Contracts.—The principal contractor having been awarded a general contract should immediately award the sub-contracts to the lowest bidder in each branch.

Article 3. Penalty for not Awarding Contract to Lowest Sub-bidder.—A principal contractor, failing to award a sub-contract to the lowest sub-bidder to whom he is under obligation as previously provided, should be liable to pay damages to the said lowest bidder, in amount not less than 10 per cent. of the amount of the estimate.

Payment of such damages will not relieve the principal contractor from liability to discipline under provisions of Article 10 of the by-laws of this Association.

Article 4. Contracts with Sub-contractors.—The principal contractor, immediately after executing a general contract with the owner, should for his own protection, as well as the protection of the sub-bidder, execute some satisfactory form of contract or agreement with each lowest sub-bidder.

Article 5. Payments to Sub-Contractors.—Unless the contracts made with sub-contractors otherwise provide, payments during the progress of the work should be made by the principal contractor to the sub-contractors upon the same basis of payment, in relation to amount of work performed, as is prescribed in the contract made by the principal contractor with the owner.

Final payment to a sub-contractor should be considered as due at the expiration of thirty days after the completion of his work and its approval by the architect or owner, unless otherwise provided by the sub-contract or agreement.

Article 6. Submission of Bids by Sub-Contractors.—Sub-contractors in submitting bids to principal contractors should enclose them in the envelopes prepared by this Association and kept on hand for the use of sub-bidders, or should endorse the envelopes in which they are enclosed in such manner that

All work supervised personally, and guaranteed for 12 months. Maintenance contracts entered into.

E. P. ALLAM & CO., 49 Finsbury Pavement, E.C.

principal contractors may know whom the bids are from, what portion of the work they comprehend, and the particular building they apply to.

Sub-contractors who fail to so enclose and endorse their bids cannot claim protection or redress under the first article of this code.

Article 7. Obligation of Sub-Contractor to Principal Contractor.—Should a sub-contractor refuse to contract at the amount of the estimate he has given to a principal contractor who has used the said estimate in good faith, he then should be liable to the said principal contractor for damages in amount not less than the difference between the amount of the estimate which was submitted by him and the amount at which the principal contractor may be obliged to contract the work.

Payment of such damages will not relieve the sub-contractor from liability to discipline under provisions of Article X. of the by-laws of this Association.

Article 8. Obligations of Sub-Contractors to each Other.—Any sub-contractor suspected of unfair treatment of his fellow sub-contractors will be liable to complaint and discipline under Article X. of the by-laws of this Association.

Article 9. Trading Sub-Bids.—Trading upon sub-bids will be considered sufficient cause for complaint and discipline as provided by Article 10 of the by-laws of this Association.

Article 10. Bids to Architects or Owners.—When bids for separate departments of work on a building are solicited by the architect or the owner, they should be submitted with the understanding that they are direct estimates, for which direct contracts are to be made by the owner with the lowest bidder, and no other disposition of such bids should be permitted without consent of the bidder submitting the same.

Sub-bids should be given only to the principal contractors who are estimating the work in question, and should not be left with architects or owners for the inspection and information of principal contractors. Sub-contractors must understand that bids thus left with architects or owners are in great danger of losing their confidential character, and that if they so leave them they cannot claim protection or redress under the first article of this code.

Suggestions.—Members of this Association having sub-contracts to let or material to buy should, as far as may be consistent with business principles, deal only with members of the Association, or at all events give their fellow-members an opportunity to compete, and then give them the preference, other things being equal.

All bidders should take cognisance of the danger they may be subjected to through the practice, so prevalent in some architects' offices, of making changes in plans or specifications, or in both, during the progress of estimating. Correction of this pernicious practice can only be obtained through refusal by contractors to estimate under such conditions.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

7993. William Birch, for "Improvements in and ventilating cowls."
8051. Wilhelm Cohn, for "Improved collapsible structure or house for travellers and the like."
8127. Paul Rordorf and David Rordorf, for "Improvements in fastenings, devices or clamps for building purposes and the like."
8154. Sidney Gamble, for "An improved ventilating sash-fastener."
8189. Frederick Harvard Stacey and George Jabez Beedham, for "Automatic apparatus for supplying disinfectants to water-closets and the like."
8224. Ralph Thomas Vaux, for "Improvements in chimney-cowls or like apparatus."
8227. Walter John Blunden, for "An improved window sash-fastener."
8229. Robert George Sherrington, for "Improvements in cowls and ventilators."
8284. Stefan v. Berzenczey, for "Improved secret lock."
8365. Henri Sturm, for "An improved system of light and economical building construction."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

SPRINKLER, Closed.

ALL
MILLS, WAREHOUSES, THEATRES AND PUBLIC BUILDINGS
CAN BE RENDERED ABSOLUTELY FIREPROOF BY ADOPTING
THE

GRINNELL SPRINKLER

THE ONLY SPRINKLER WITH A RECORD.

Has Extinguished 2,000 Fires with an Average Loss of £50,
Protecting Property to the Value of £120,000,000.

Unlike all other Sprinklers, the GRINNELL is constructed entirely without Springs, Screws, Hinges, and other Mechanical make-shifts, so liable to derangement.

IT IS THE LEADING FIRE APPLIANCE OF THE DAY.

DOWSON, TAYLOR & CO., LTD. LONDON: 14 Victoria St., S.W.
MANCHESTER: Blackfriars Bridge. And at GLASGOW and PARIS.

HARDYS' PATENT

No. 15,811.

For Prices and further Particulars apply to the

SOLE PATENTEES—

MESSRS. H. & J. HARDY,

ALBANY WORKSHOPS,
SWANAGE, DORSETSHIRE.

No. 2.—AUTOMATIC SELF-LOCKING ACTION.

No. 3.—THE SELF-HELP FASTENER.

A large number already in present use giving full satisfaction. Unrivalled.

COMBINED STAYS AND FASTENERS FOR CASEMENTS AND FANLIGHTS.

WE beg to call your special attention to our Patent Combined Stay and Fastener, which, from its great advantages and easy mode of use, can well claim a superiority over the common kinds. You will notice that this Fastener has no complex system of working, is easy to fix, and, whether the casement is open or shut, does not project into the room, but hangs down the centre of the sash free from curtain or blind. The advantage of this Patent Fastener is that, being fixed in the centre of the sash, it affords protection against sudden gusts of wind when open, and keeps the sash safely closed when shut, as it acts as a fastener for the casement as well as a stay. Each of the three kinds of Fasteners affords the same advantages in all respects, as, though varying in shape, size, and price, are only different ideas of the same method. These Casement Fasteners can be used both for wood or iron, for single or double casements. The special pattern is used for fanlights to open outwards, and all can be used both for right or left hand. We can supply these Fasteners in any number of links, according to the extent the casement is required to be opened. We may also note that the Fasteners are well made and finished, can be had both in brass and iron, and are, therefore, well suited for any kind of application. Also testimonials. Please state in ordering whether you require them for single or for double casements.

Stay and Fastener shown in Action.

Cases for Binding the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

THE

Architect and Contract Reporter.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ILLUSTRATIONS.

DESIGN FOR A ROMAN CATHOLIC CATHEDRAL.

ELEVATION OF PROPOSED CHAMBER OF COMMERCE, LONDON.

THE NORTH PORCH, AUDLEY END, ESSEX.

TRADE NOTES.

THE new building of residential flats, Wellington Court, Knightsbridge, with an unsurpassed view of Hyde Park and Rotten Row, was on Tuesday afternoon opened for letting by the directors. After the building (which is very attractive and highly decorated, and fitted with all the latest improvements) had been inspected, a test was made of the passenger lifts, to demonstrate their safety in working. These lifts have been erected by Messrs. R. Waygood & Co., Limited, upon the patent safety principle adopted by them. The cars are suspended by four steel wire ropes, the failure of any one causing the cams or grippers to be pulled into action by the remaining sound ropes. There is also a fifth rope of lighter make which runs idle, and whose only duty is to pull the cams into action in the highly improbable event of all the four lifting ropes breaking simultaneously without first having brought the safety apparatus into action. The apparatus was tested by the severing of one of the ropes at the most trying place (near its anchorage), while Mr. Walker, Chairman of Directors of Messrs. R. Waygood & Co., Limited, was in the cage, which was instantly stopped by the cams gripping the timbers at the back of the girders, erected for that purpose.

THE contract has been let for the erection of the tower of St. Bartholomew's Church, Nelson Street, Bolton, and the constructive work will be commenced at an early date. The new structure, along with a peal of bells, is being provided through the bequest of the late Rev. R. Loxham, who, with his brother, the Rev. T. Loxham, of Great Lever, had always evinced a deep interest in St. Bartholomew's parish. The tower will occupy a position at the north-east angle of the nave of the church, will harmonise in its design with the present building, and will be a conspicuous object as seen from the principal streets in the locality. Mr. Freeman is the architect.

AT the Holborn Restaurant an innovation from New York has just been introduced in the shape of a lady type-writer

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the aient edifices of Belgium, scarcely any can be found which give a reproduction of her admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM, by HENRY BEYAERT, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work will be published in twenty to twenty-five parts, consisting of ten folio plates each, appearing quarterly. Thirteen parts are already out. Subscriptions are received for the entire work only. Price per part, 12s.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The third year of the New Series (1893) is in preparation, and will form the eighteenth year of the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, héliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

stationed in the vestibule, who is prepared to take down in shorthand and instantly transcribe for signature the letters of hurrying guests. In the American hotels not only business and social letters, but offers of marriage are frequently transmitted by this method—the shorthand notes, in the case of very private communications, being returned to the dictator if desired.

THE *Carlisle Journal* is informed on reliable authority that the new steelworks at Maryport started a few years ago by Messrs. Hampton & Facer, on the site of the Ellen Rolling Mills, have been transferred from Captain Robinson, of Workington, to a number of Maryport gentlemen who are anxious to resuscitate the industry. On Saturday a meeting of the new proprietors was held at Maryport, when the prospects of the venture were talked over and some details of a private nature arranged. So far, no scheme for restarting the works has been adopted.

THE building committee appointed to promote the erection of a new residence for the vicar of Holy Trinity, Birchfield, the Rev. W. F. Bradley, have accepted the contract of Mr. G. Trentham at 1,644/. The building will be commenced at once under the superintendence of the architect, Mr. R. Matthews. Mr. Trentham lately completed the new rectory house at Handsworth, and is also engaged in building the vicarage at Selly Hill.

THE Farnworth Fever Hospital, Bolton, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke-flues and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

AT the monthly meeting of the North Staffordshire Mining Institute, Stoke-on-Trent, Mr. E. B. Wain presiding, Messrs. H. I. Williams & Co., Fenton, exhibited a patent corrugated iron pit tub, which was stated to be lighter and stronger than ordinary tubs.

THE Acme Wood Flooring Company, Limited, write:—We have much pleasure in announcing the completion of and removal to our new saw mills and manufactory, situated on the River Lee Navigation, extensively fitted with the most modern machinery to meet the growing demand for our patent "im-movable Acme" flooring, and to supply wood block flooring and paving of every description prepared ready or laid complete at low prices, to compete with a department of trade now monopolised by foreign manufactured material.

THE works committee of Dundee Town Council have accepted the contract of Mr. Robert Sheach, jun., amounting to 1,192l. 10s., for laying the causeways between the tramway rails in Victoria Road, Dens Road and Dura Street.

BUILDING AND BUILDERS.

THE *Birmingham Post* says:—We regret to hear of the death of Mr. Robert William Fitzmaurice, which took place on Friday, the 10th inst., at his residence, 16 York Road, Edgbaston. The deceased gentleman was sixty-four years of age, and for the greater portion of his life he was actively engaged in business associations which made him one of the best-known citizens of Birmingham. He served his articles with Mr. Pigott Smith, the first borough surveyor of Birmingham—a man who did so much to start and give impetus to the improvement of the town. Through his profession few men watched with more interest than Mr. Fitzmaurice the gradual development of the city, and after he became a member of the firm of Jones & Fitzmaurice, contractors, his connection with the improvements of Birmingham took a very practical form. The firm carried out most of the important works, notably the main conduit of the sewage outfall at Salfley, the formation and making of Corporation Street, and the first laying of considerable portions of the tramway system within the borough. The firm also laid large quantities of footway and carriage-way pavements in the city, and recently they undertook for the Corporation and the Aston District Council the improvement of the lower portion of the Hockley and Aston Brook, and the construction of a storm-relief conduit between Summer Hill Street and Morville Street.

PLANS have been approved for the erection of a new Roman Catholic Church at Westthoughton. The plans were prepared by Mr. Thomas Burgess, architect, of Haigh, near Wigan.

AT the meeting of the Walsall Town Council the health committee reported, amongst other matters, that a house-to-house inspection of 1,276 houses, in certain specified streets, had been made, and that they had rescinded their previous resolution in favour of the provision of a hospital for the treatment of smallpox patients only, and had instructed the borough surveyor to submit fresh plans for an isolation hospital, showing what buildings could be provided for 3,000l., exclusive of a boundary wall.

OFFICE: 175 STRAND LONDON, W.C.

At a meeting held in Brechin a letter was read from the trustees of the late Rev. Alexander Gardner, of Brechin, who by his will directed the larger portion of his estate to be devoted to the endowment of a new church and benefice in Brechin, intimating that two friends of the late Mr. Gardner had signified their desire to take advantage of the opportunity afforded them to give a donation of 7,000*l.* towards the erection of a church, vestry and hall, and for providing in due time a suitable manse for the minister of the new church.

GOVANHAUGH Paper Mill, Pollokshaws, has been completely destroyed by fire. The loss is estimated at 5,000*l.*

At Dundee, Mr. George Henderson, of Perth, has been appointed clerk of works at the Municipal Buildings, Dundee. The remuneration to Mr. A. Grainger Heiton, architect, for his services in connection with the restoration of the Municipal Buildings has been fixed at 3½ per cent. on the ultimate cost of the work. The following dates have been fixed for completing the various departments of the work, under penalties for failure:—Mason, August 1; joiner for roof, August 17; slater and plumber, September 1; plasterer, October 12; joiner fittings, &c., November 9; and painter, November 30.

THE erection of new buildings of a total value of 12,000*l.* has been sanctioned by the plans committee of the Aberdeen Town Council. The plans included thirteen dwelling-houses, and the extension of the Ice Company's premises at a cost of 2,000*l.*

THE report of Major Marindin on the recent collapse of Guildford Tunnel has been issued. He attributes the accident mainly to pieces of wood used for supporting the arch in course of construction and built into the brickwork, where they had rotted. Where they were built in, the thickness and strength of the brickwork were reduced; but a worse effect of these rotten pieces of wood would be the channels thus formed for percolation of water. Major Marindin has little doubt that the fall of the tunnel was due to a cavity hollowed by the action of water, probably at one of the branches. As this cavity increased in size the arch became so unevenly weighted that it collapsed.

ON Tuesday at the West Bromwich County Court, before Judge Griffiths, S. C. Wood, brick manufacturer, West Bromwich, sued Webb & Co., Newton Street, Birmingham, builders, to recover 30*l.* 8*s.* for bricks delivered. The defendants counter-claimed for 80*l.* damages for alleged breach of contract by failure to deliver the bricks. After a protracted hearing

judgment was given for plaintiff for 22*l.* and costs, the counter-claim being dismissed with costs.

THE Aberdeen University Court on Tuesday decided that the completion of the south wing of Marischal College is to be proceeded with, leaving the central detached building to be afterwards undertaken. The Marquis of Huntly stated that it was not improbable that application would be made to the Government for a further grant of 10,000*l.* To finish the scheme in its entirety will require 35,000*l.*

MR. ALBERT MURRAY, of Dublin, has prepared plans for the small cottage hospital which is to be erected near Bray as a Hely memorial.

THE Manchester Ship Canal Warehousing Company have purchased a large area as sites for buildings, and will at once commence with warehouses which will cost nearly 100,000*l.*

IT is proposed to expend 5,500*l.* in providing a hop market and the necessary warehouses at Hereford. A building in Broad Street has been provisionally purchased at 4,000*l.*, and it is intended to lay out another 1,500*l.* in making the required alterations and additions. The Town Council also intend expending 3,000*l.* in improving the water supply, making improvements in connection with the waterworks and laying down new mains. The old mains generally were laid about forty years ago, and the late prolonged frost caused much havoc.

DURING a gale at St. Helens on Wednesday morning a brick chimney, 100 feet in height, at Hardshaw Brook Chemical Works, was blown down. The pile fell in a direction from the adjoining buildings, and no one was injured.

ELECTRICAL.

At the meeting of the special lighting committee of the Liverpool City Council on Monday, satisfactory reports on the condition of the plant and property of the Electric Supply Company, Limited, in view of the proposed purchase by the Corporation, were presented from Sir Frederick Bramwell and the city auditor, and a draft agreement for the purchase at the total cost of 400,000*l.* was adopted.

THE Mersey Railway Bill, authorising the use by the company of electricity as a motive power, has been passed by the House of Lords committee.

THE lighting of Perth Waterworks by electricity was inaugurated on Monday night.

150 HOPE STREET, GLASGOW.

THE sub-committee of the Bolton Town Council have received tenders for supplying and laying electric mains in Spa Road, Marsden Road, St. George's Road, Higher Bridge Street, Halliwell Road, Moor Lane and Derby Street, and they were referred to Alderman Miles, Councillor W. Cooper and the engineer for inquiry and report. The engineer submitted a tabulated list and analysis of the tenders for the supply of engine and alternators in the extension of the electricity plant. The tender of Mr. S. de Frante, London, for the supply of the alternator was accepted, as was also that of Messrs. Hick, Hargreaves & Co. for the engine, subject to certain details being carried out to satisfy the engineer. A communication was read from the Local Government Board stating that in reference to the application of the Corporation for the sanction of the Board for the borough to borrow 17,300*l.* for electric purposes, they intended to hold a local inquiry on the subject.

THE question of illuminating the churches by electricity is being discussed in Rome, and it is believed that this method will be allowed, except on the altars, which, as before, will only be lighted by wax candles or lamps with olive oil.

AT the monthly meeting of the Rhyl Urban District Council, Captain E. W. Keatinge, J.P., presiding, it was reported with regard to the new marine lake that the water would first be let in on the 24th inst. An application was received from a Birmingham firm asking for permission to construct an electric railway between Rhyl and Prestatyn, which is under consideration.

VARIETIES.

THE Eastbourne Town Council have obtained the sanction of the Local Government Board to borrow 77,000*l.* for drainage works, of which Mr. Henry Law is the engineer.

THREE French contractors have been raised from the rank of chevalier to that of officer of the Legion of Honour, viz. M. J. Claret, of Lyons; M. F. Bertrand, of Paris; and M. P. Hersent, of Paris. M. Many, another contractor, has been nominated a chevalier.

AT a special meeting of the Durham City Council the plans were considered for sewerage the city and the construction of sewage purification outfall works. The first premium was awarded to Messrs. Lomax & Lomax, Manchester, Mr. D. Balfour being awarded the second premium.

SANCTION has been obtained by the Westhoughton Burial Board to borrow 2,000*l.* for extension of the present cemetery.

THE Berlin correspondent of the *Standard* says:—The problem of employing spirits for lighting on a new principle, similar to the incandescent gas light, has been solved with great success by a Berlin firm. Experiments have just been carried out in presence of the Prussian Ministers, Herren Berlepsch, Miquel and Hammerstein, which are reported to have been completely satisfactory. If this news is confirmed, it is likely to prove of enormous importance to the German spirit industry, which has recently been in *extremis*.

THE *Manchester Guardian* says that the waterworks committee are appealing to the citizens to be economical in the use of water. The engineer has reported an increase in the consumption as compared with last year of over four and a half million gallons per day, and he is of opinion "either that there is considerable waste or an unnecessary use" of water now taking place. He warns the committee that if the increase continues for any length of time they will find themselves in a very difficult position.

DAMAGE, estimated at 2,000*l.*, has been done by a fire at the pottery works of Messrs. Wood & Hulme, Burslem. Upwards of a hundred persons will be thrown out of work by reason of the fire.

THE London and North-Western Railway Company, it is stated, have purchased some thirty acres of land at Flint, abutting on the Chester and Holyhead Railway, for the purpose of developing their property and erecting cottages for workmen.

THE *Irish Times* says:—Three important railway officials from South Africa are on a visit to Ireland inquiring into the working of different systems of light railway in this country, with a view to the introduction of similar lines into South Africa. Within the past few days they have been examining into the light railways in Kerry and observing the working arrangements of the lines in that county. They went to Cork subsequently, and inspected the Cork and Muskerry line, which is admittedly one of the most successful systems of its kind in Ireland. On their trip over the Cork and Muskerry line they were accompanied by the manager, Mr. J. B. Wilson. The visitors when they have duly inspected all the different systems of light railways in Ireland will fully report to their Government on the merits of the lines of light railways in this country.

AN experiment in acoustics was tried in Philadelphia on Monday in the Baptist Temple, the largest church building in Philadelphia. The temple has two auditoriums, one on the lower floor, the second on the one above, where there are besides several smaller meeting-rooms. These were all connected one with another and with a gigantic telephone by means of wires. The service, the sermon and the music were all produced in one room, where the large telephone stood near the pulpit and the organ. A large transmitter was placed in each of the other rooms, so that the sermon, service and hymns were distinctly audible and intelligible to the crowded audiences that filled the other auditorium and the meeting-rooms.

ON Wednesday, at the Lambeth Police Court, Mr. John Pullen, the owner of property in Manor Place, Walworth, known as Pullen's Buildings, appeared to an adjourned summons taken out by the Newington Vestry, who complained that certain sanitary defects existed at the premises, which are let out in tenements. Mr. Hopkins, the magistrate, said he had had the advantage of seeing the premises. The Vestry were, in fact, attacking the system of drainage in these premises, which was admittedly not such as would satisfy the new by-laws of the County Council. In his view, the first thing the Vestry had to do was to show that the premises were in such a state as to be a nuisance and dangerous to health. He had come to the conclusion that at no time were the premises in such a state as to be a nuisance or dangerous to health, and he should therefore dismiss the summons.

AT the meeting of the Stratford-on-Avon Town Council, it was resolved on the recommendations of the joint hospitals committee, to admit pauper smallpox patients, who would otherwise have to be treated at the workhouse, upon the guardians agreeing to pay the committee the actual costs incurred by them. It was stated the erection of the hospital was one of the best investments ever made by the town. It was resolved to build a porter's cottage in connection with the hospital at a cost of 350/.

A FIRE occurred at the Anaglypta Paper Mill, Darwen, on Monday evening, and damage amounting to about 2,000/ was done. The fire originated from an unknown cause in the eighth storey of the building. The premises were soon gutted and valuable machinery destroyed.

THE Stamford Town Council has received from Mr. G. H. Hill, C.E., of Manchester, a report on the water supply of the town. He recommends the adoption of a scheme for obtaining water from Braceborough, near Bourne, about ten miles away, a scheme which was also recommended some years ago by the late Mr. Hawkesley.

AT the meeting of Langholm police commissioners, a letter was read from Mr. Carthew Yorstoun, chamberlain to the Duke of Buccleuch, enclosing a deed of conveyance by which his Grace handed over to the commissioners as a free gift the Town Hall of Langholm and the ground it is built on, the only condition being that it should be used for the public benefit. The building is to be handed over at Whitsunday first.

THE Uckfield Water Company have decided on a scheme for the construction of a storage reservoir at their pumping station, for which tenders are invited. Mr. J. Lewis, of Shoreham, is the engineer.

A COOKERY SCHOOL is about to be erected in Elm Grove, Brighton, by the School Board.

A SWEDISH collector, the late Carl Dahlgren, of Stockholm, has left the National Museum in that city 432 watches and clocks, 1,121 boxes, and 4,435 miniature paintings. A provincial museum receives 1,920 pictures. The Dahlgren collection numbered about 10,000 objects, stored away in six rooms, affording an extraordinarily ingenious use of the space. The very bed curtains were thickly sewn with watches and miniatures.

NEW CATALOGUES.

A LARGE and bulky catalogue containing about 100 pages has been issued by Messrs. Doulton & Co., of Lambeth. In publishing a new edition of their sanitary catalogue, Messrs. Doulton & Co. say that they have endeavoured to embrace all the designs approved by the leading authorities, and at the same time to meet the demand for really effective appliances combined with artistic decoration. To attain these ends Messrs. Doulton have constructed additional works and foundries at Paisley, so that in conjunction with their several potteries and art studios in Lambeth and Staffordshire they have under their own control the whole of the manufacture and finish of the different fittings, and thus are in an exceptional position to execute with despatch orders from their own patterns, as well as being in an absolutely unique position for carrying out special designs submitted to them. At the outset the eye is caught by the carefully compiled and classified index, which by itself covers twelve pages. The first section which follows is devoted to "Closets, cisterns and fittings." Many of the illustrations are excellently reproduced in colours,

which are of use in enabling any person to judge of the effect of the articles *in situ*, with tile or other wall decorations, &c. An excellent pattern of Doulton's improved cast-iron shelters for trough closets is illustrated, being a very useful appliance at factories for closets and urinals when detached from the main building; also plumber's brasswork and effectively designed tilework. The "Metallo-Keramic" joint is particularly deserving of attention. The great merit and novelty of this joint is that it insures a perfect junction between the pottery trap of the closet and the lead soil-pipe. Many trials have been made in this direction, but have hitherto failed, and this is the first time that complete success has been attained, owing to the perseverance of Messrs. Doulton. The thorough incorporation of the two materials, which render entrance of sewer-gas to a house impossible, is got by a special and patented process. The illustrations and description will be found on pages 2, 3 and 4. After thorough and exhaustive tests it took the only medal at the Sanitary Congress, Liverpool, 1894. Other important additions and improvements will be found in this section. The last issued catalogue was dated 1890. The glazed and enamelled tilework for wall-linings give an excellent idea of the work that may any day be seen at Messrs. Doulton's showrooms. Another section deals with "Baths and fittings, plunge, spray and shower," as manufactured at their Paisley works. Special attention may be directed to their wide rolled edge cast-iron baths, both in metallic and glass and porcelain enamels, all excellent in quality and finish. The designs for bath decoration are another praiseworthy feature of the catalogue. Nearly every known kind of bath is illustrated. The next section is devoted to "Lavatories and fittings," and another section to "Automatic flushing tanks, flushing syphons, manhole covers, &c." These lists have been carefully revised, and many important and new additions appear. The section for "Urinals and fittings" contains a great variety of appliances, from simple and cheap to the best and latest form of glazed white and decorated backs and bases. An automatic and perfect flush is provided for the urinals, and the periodical discharge can be regulated as to time. They are especially suitable for public buildings. We have now done as much justice as possible in the short space at disposal as the exhaustive nature of the catalogue will permit of, and while recommending it to our readers we would advise those who have the opportunity to visit the showrooms of Messrs. Doulton, on the Albert Embankment, and examine the immense display of useful and beautiful appliances to be seen there. It may be mentioned in conclusion that new methods are invented from time to time and improvements developed, and therefore at the end of each section slips are provided to which new sheets as they appear can be attached.

CHICHESTER DRAINAGE WORKS.

AT the last meeting of the drainage committee of Chichester the following letter, written from Mr. Baldwin Latham (the engineer) to Mr. Peters (the contractor), was submitted, and the committee recommended the Council to assent to the course proposed to be taken by Mr. Latham:—

May 1, 1895.

Dear Sir,—Having regard to the extraordinary delays which have taken place with reference to the non-fulfilment of your promises with regard to the removal of the stoppage from the sewer between M and M2, I have to inform you that if this stoppage is not cleared within a week from the present date, or some satisfactory method adopted for dealing with the matter, I shall apply to the Urban Sanitary Authority for power to give you notice to take the whole of this portion of the work out of your hands, and employ some competent person to complete the same, and the cost thereof will have to be borne by you.—Faithfully yours,

(Signed) BALDWIN LATHAM.

P. Peters, Esq., Contractor, East Street, Horsham.

The committee considered Mr. Peters's application for an extension of the time for the completion of his contract, but were not prepared to recommend the Council to extend the time within which the contractor is to complete his work, and that he be informed that the Council have decided to waive none of the penal clauses against him, but that expedition on his part now may be taken into favourable consideration by the Council hereafter, provided that it be understood that this resolution shall not prejudice the previous resolution. At a further meeting of the committee on May 10 the following letter from Mr. Baldwin Latham was read:—

"Dear Sir,—I regret to have to state that, after having given Mr. Peters repeated notice respecting the removal of the stoppage from the sewer in the fields between the letters M and M2, and he having repeatedly promised me that this stoppage should be removed without any delay, yet, after many months, matters remain exactly as they were. On the 1st of this month I gave him notice that, unless within

seven days the stoppage was removed, I should make an application to the Corporation of Chichester, under the provision of clause 6 of the specification, to be allowed to take this part of the work out of the hands of Mr. Peters, and employ some other person to do it. In consequence, therefore, of the many months' delay in this matter, and nothing having been satisfactorily done, I request the Corporation of Chichester to authorise me to take this portion of the works out of Mr. Peters's hands and employ some other person to do it. I enclose you a certificate for 810*l.* in favour of Mr. Peters, and I have forwarded the usual monthly accounts to the city accountant, but I must request you to withhold the certificates under clause 80 of the specification, as I have given Mr. Peters notice that I shall withhold this until I am satisfied he is making progress with the remedying of the defective works, which will cost a considerable sum to rectify, and which up to the present time he has not done.—Faithfully yours,

BALDWIN LATHAM.

Edwin Arnold, Esq., town clerk, Chichester.

It was resolved that the certificate for 810*l.* be withheld accordingly.

SPURN LIGHTHOUSE.

THE old lighthouse at Spurn, which has befriended the mariner for twenty years more than a century, will soon be superseded by an entirely new structure, in the erection of which upwards of 300,000 Staffordshire bricks have been used. The new house will be supplied with a triple light. The old lighthouse, associated with the great engineer, Smeaton, was commenced in 1771, and completed in 1773. In the sixth year of George III an Act was passed for taking down and rebuilding the lighthouses then existing at Spurn, one to be 50 feet and the other 90 feet high. The lighthouse at present in use is called the "high" lighthouse; the "low" light was destroyed in 1776, and again in 1786, after being rebuilt by Smeaton. It succumbed subsequently to the fury of the sea on three occasions, the last in 1830, and was never again upreared. The "high" light is a circular tower, with several storeys. Smeaton himself, writing of the two lighthouses in 1793, says, "I had the great satisfaction to find at Hull that the Spurn lights were in such credit among the seamen that they were both esteemed, on account of their clear and brilliant light, to be the best lights in Europe. Frequently the great light of the Spurn has been seen in clear weather from the high ground near Beverley, a distance of

thirty miles." The first lighthouse erected at Spurn of which there is any record was constructed by a hermit in the reign of Henry IV., and to assist the hermit in his laudable work a duty of 1*s.* was levied on every ship of 120 tons and upwards, 8*d.* on every vessel of 100 tons, and 4*d.* on every vessel of a less burden, coming from the sea into the Humber, which rates were to be received by the Mayor of Hull, for ten years from the date of the patent (1428).

THE PROGRESS OF THE IRON AND STEEL INDUSTRIES.

AN address was delivered by Mr. David Dale, as president of the Iron and Steel Institute, at the annual meeting on the 9th inst. He reviewed the changes which had taken place, and the progress made in the iron and steel industries since the formation of the Institute in 1869. Although much of the work of technical instruction throughout Great Britain was at present necessarily of a somewhat tentative character, yet a great deal of good work was already being done, and it might be said to-day that, in all our principal manufacturing towns, sound instruction in the physical sciences, and their applications to particular industries, had been brought to the door of our workers at little more than a nominal charge. It was as yet too early to reap to any appreciable extent the benefit of this change of state of things, but it was something to know that large numbers of our apprentices and younger workmen were availing themselves of the facilities placed within their reach, and we might confidently hope that a few years would now bring forth marked results in the added intelligence which would be brought to bear upon all our varied industrial occupations, and also that the general effect of wider intellectual interests would, unless counteracted by other influences, tend more and more to the development of that spirit of reasonableness which was such an important desideratum in the relations of labour and capital. In making a comparison between the present and the past of twenty-five years ago, it had seemed fitting to dwell a little upon the training of the worker as being a not less important element in the question of successful production than the nature of our iron ores, the perfection of our machinery, or the facilities of our transport system, seeing that the elimination of ignorance and unreasonableness was no less a factor in the problem than the removal of phosphorus from steel or the impurities from fuel, and was of value even from a purely utilitarian and commercial point of view. The labour difficul-

Established 1860.

ties, which were such a serious hindrance to the steady conduct of the trade, were still with us from time to time, and, in their most serious developments, owing to the more complete organisation of labour, even at times assumed the proportions of an industrial war, ruinous alike to masters and men. They could not, however, but note with satisfaction the large extent to which, pre-eminently in their own particular trades, the principles of conciliation and arbitration had replaced the more barbarous methods of brute force, and through their present application had been the means of averting many a disastrous conflict. The North of England Board of Conciliation for the manufactured iron and steel trades was formed in the year 1869, and since then almost every point of difference which had arisen had been peaceably settled through its agency. The application of the system of conciliation and arbitration on such a large scale as was incident to a great industry like that of the northern iron and steel trades gave a great impetus to its widespread adoption, not only in trades allied to these, but in connection with most of the leading industries of the country, whilst frequent inquiries as to our methods from foreign correspondents testified to a growing appreciation of these principles in the other great manufacturing countries of the world. Mr. Dale pointed out that whereas in 1879 88 per cent. of the total tonnage of ships was of iron, the tonnage of steel had now risen to over 96 per cent. of the output. Then steel plates cost 18*l.* to 20*l.* per ton, whilst to-day they could be bought for 4*l.* 15*s.*, a parallel declension having also taken place in the price of steel rails. To what was this contrast between the values of the present time and of twenty-five years ago due? How much of the difference could be credited to improved methods of manufacture, and how much to other causes affecting the course of trade? Before attempting any answer to this question, the President passed in rapid review the history of the more important processes which have come to the front during that period—the Bessemer, the Siemens, the Siemens-Martin, the Gilchrist Basic Bessemer process, and the like—including a reference to the labours of Sir Isaac Lowthian Bell in connection with the theory and practice of blasting, also going very largely into statistics. As to the output of pig-iron, the percentage of increase in the United States on the output of 1869 was no less than 435 per cent., whilst in England it had only increased 23 per cent. The percentage of increase in Germany was 249, in Austro-Hungary 132, in Russia 162, Sweden 66, France 46 and Belgium 41. As to steel the percentages of increase in the

steel-making countries was very marked. The United States showed the remarkable advance of 13,236 per cent., the United Kingdom 979 per cent., Germany 1,511, Austro-Hungary 1,500, Belgium 886, Sweden 1,109 and Russia 4,136. A remarkable feature, and one deserving the most careful consideration from the point of view of our home industries, was the constantly increasing proportion of pig-iron ore used in the production of our pig-iron to that which was raised in many instances within a few miles of our blast furnaces, despite the successful establishment of the basic process, which solved the production of steel of high quality from phosphoric ores such as that of Cleveland. In 1880-82 the quantity of ore raised in the United Kingdom showed an increase of 36 per cent. on that of 1869, whereas in 1893 we actually raised 300,000 tons less than in that year, and at the same time were importing a quantity closely approximating to our principal ore district, and representing a money value of over 2,000,000*l.* sterling, which would otherwise be circulating in the form of wages in our own country. This state of things was likely to continue, so long as it paid better to convert foreign ore by the acid Bessemer open processes than Cleveland ore by the basic, and relief could only be looked for in the direction of further improvements tending to increased economy in the basic process, unless the foreign ore should rise to a point at which our native ore could successfully compete with it, which might afford some satisfaction to the English mineowner, but at the price of an increased average cost of our total output of steel. The present was a time of phenomenal cheapness in all productions, and men were beginning to ask, with the late president, Mr. Windsor Richards, "Of what use is it to construct labour-saving machinery, and so throw more men out of employment, when we have already thousands of willing hands out of work, when every improvement is at once adopted by our competitors, and every increase of technical knowledge only seems to open out new sources of competition?" The process, however, under the present condition of trade seemed to the President to be inevitable. The severer the competition the less could we afford to neglect any means by which excellence of quality and economy of production could be secured. As in the organic, so in the commercial world, the process of natural selection and the survival of the fittest was ever going on. The operation of the inevitable and inexorable law would ever tend to eliminate the less favourably situated, and to concentrate production in the hands of those vast concerns whose resources were such as to enable them

OPTIMUS SUPERIOR PHOTOGRAPHIC OUTFITS.

EXTRA LONG FOCUS CAMERA.

British Journal of Photography says:—"The present model Rayment Camera is among the very lightest of actually rigid cameras offered to the public. The rapidity of opening and closure is greatly facilitated by the additional arrangement for throwing the pinion out of gear from the rack. There is no curtailment of view when lenses of short focus and wide angular aperture are in use." All movements necessary to the modern scientific photographer are included in this compact instrument."

1a CRESCENT, MINORIES, LONDON, E.C.

to maintain the struggle in exceptionally hard times, as well as to avail themselves of every improvement in processes of manufacture, upon the adoption of which their continued existence would depend, and which were denied to their less favoured competitor. In ordinary times practically the whole of the proceeds of manufacturing operations tend more and more to go into the pockets of the worker. It was right that labour should have its fair share of remuneration, but any artificial restraints in the law of supply and demand, whether in the form of shorter hours of labour or otherwise, must enhance the cost of production. If the result of fixing a minimum wage was to impose a cost of production which could not compete with the cheaper labour of foreign countries, wages must eventually come down. But of all the mad and fatal expedients for driving away trade, none were so mad and fatal as the gigantic and prolonged strikes which from time to time disfigured the face of our industrial records. Never in the history of the world was there so much accumulated capital waiting for employment, but owing to the unstable conditions of industrial enterprise capitalists at the present time preferred securities yielding 2 or 3 per cent., where there was some assurance of stability, to the more precarious trade investments which had ceased to offer the possibility of a return commensurate with the greater risk which they involved. The State had legitimate functions to fulfil in fostering the trade on which the empire depended; but State action would more profitably be directed to the opening out of more extended fields of enterprise throughout the empire than imposing regulations which tended to enhance the cost and restrict the operations of our home industries. What might be the effect of opening up the markets of the world by events now passing in the East no one could tell. The Japanese asserted that in five years they would be the largest exporting country in the world, their programme being to exercise their unsurpassed imitative faculty in reproducing the various manufactures of the world by aid of their cheap native labour, which they thought would enable them to undersell the nations of the West. The question was to whom would be the spoils of industrial conquest. The figures he had quoted, even if they did not supply any very definite or satisfactory solution of the problem, might at any rate supply food for thought, indicating as they did a state of things which was sufficiently critical to point the moral that neither capital nor labour could afford to do anything to hamper the cordial co-operation by which alone the prosperity and well-being of the community could be secured.

SOUTHPORT PIER.

ON the 10th inst. in the Nisi Prius Court, Liverpool Assizes, before Mr. Justice Kennedy and a special jury, an action was brought by the Southport Pier Company, Limited, to recover 500*l* from the Southport Corporation in respect of damage to their pier, alleged to have been caused by trespass by the defendants. The defence was a denial of trespass.

Counsel said that the damage was done by reason of a large quantity of sea water which was collected upon the Southport shore during the execution of certain works by the Corporation, and which was allowed to escape with very great violence on the night of December 13. Many years ago the Pier Company erected a long pier for the accommodation of visitors. In 1892 the Corporation constructed a circular marine drive at the Birkdale side of the shore. The effect of the work was to enclose a considerable area, as it were, within three walls, and the water that collected in that area caused the damage complained of. The Corporation had evidently contemplated that water would collect there, for they put in two culverts to carry it off. On the evening of December 13 the pier was left in a perfectly sound condition. During the night there was an unusually high tide, and about five o'clock in the morning some fishermen going along the pier to their boats heard a great rushing of water, accompanied by a cracking noise. Subsequently it was discovered that the sand had been washed away to a depth of 18 feet by the tremendous scour of water which had taken place; the iron piles of the pier, which had been driven into the sand to a depth of 10 feet, were left dangling in the air, their points being 3 feet from the sand, while the girders overhead had sunk 5 feet below the level. The defence of the Corporation was that the culverts had been duly closed on the preceding night and must have been opened by someone not connected with the Corporation. The Pier Company, on the contrary, would prove that the culverts had been left open. If the Corporation had laid the culverts down to low-water mark, as they had done in the case of the marine lakes, the casualty would not have happened. In addition to damages, therefore, the plaintiffs asked for an order requiring the defendants to carry the culverts down to low-water mark. It was denied that the pier was in a rotten condition, as alleged by the defendants.

Counsel for the Corporation said that the defence was that the damage had been caused by the scour of the tide about the

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,

BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for Issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

bases of the pier piles, which carried away the protecting stones. Evidence was given that early on the morning of December 13 a large quantity of water was seen escaping from the culverts, uniting into one stream, and rushing with great force under the pier where the breakdown took place. The superintendent of the pier described the effects of the removal of the sand on the pier, which had sunk 5 feet. He had known the pier for thirteen years, and he would not admit that there had been difficulty for some years in contending against the excessive scour of the tide. Occasionally 200 or 300 tons of stone had been put down to protect the piles. It was not true that the "bog-hole" had been extending landwards rapidly every year, but it had come in a little. Witness was further examined as to periodical expenditure by the company to counteract the effect of the tide, as shown by the company's annual reports.

Mr. Robert Watson, chairman of the company, said that the channel formed by the water escaping from the culverts was wider and deeper than an ordinary canal, and he had no doubt that this caused the damage. Mr. John Sutton, architect and surveyor, gave a similar opinion. Mr. John Brunlees, consulting engineer to the Pier Company, corroborated, and said that in 1892 he recommended the expenditure of 9,500*l.* upon the pier, but only 6,000*l.* was spent. The stonework he recommended for levelling purposes was not carried out, but the state of the stonework had nothing to do with the damage to the pier. To prevent a recurrence of the accident the culverts ought to be extended to the low-water line. Sir George Bruce, past president of the Institute of Civil Engineers, said that after a lengthy investigation of the matter he had come to the conclusion that the damage had been caused by the rush of water from the culverts. Mr. James Abernethy, also a past president of the Institute, corroborated.

For the defence it was contended that there was no doubt that water did come from the 24-inch culverts, but it was impossible that that could have made a hole 10 feet deep under the pier at a distance of a quarter of a mile from the culverts. The damage to the pier had been caused by the action of the tide, and this view was strengthened by the previous experiences of the company.

Lieutenant Sweeney, marine surveyor, deposed that on the night in question the tide at Southport was 28 feet high. That was not extraordinarily high. Thomas Rimmer, Corporation workman, said that at five o'clock on December 13 he closed the two culverts, and at eight next morning opened them

owing to a considerable collection of water within the embankment. Robert Rimmer, also in the employ of the Corporation, said that at eight o'clock on the morning of the 14th there was no water coming from the culverts. Mr. R. P. Hirst, assistant engineer to the Corporation, gave it as his opinion that it was not necessary to carry the culverts down to the low-water line. Mr. William Crabtree, borough surveyor, testified that he thought it was impossible that water flowing from the culverts could have made the depression under the pier. In his opinion the tide forced its way up, and the channel from Birkdale, flowing along with it, had made the depression. A number of fishermen were called, and stated that the tide often made gutters and pools on various parts of the shore in an unaccountable fashion. Sir Douglas Fox, vice president of the Institute of Civil Engineers, said that it was a physical impossibility that the water from such small culverts could have created the channel in question. The low-water stone wall should have been carried further shorewards. Mr. L. F. Vernon Harcourt, C.E., gave similar evidence, as also did Sir Benjamin Baker, who added that erosion from culverts could always be guarded against by providing an apron of stones for a few feet in front, beyond which the effect died out very rapidly. He attributed the accident to a combination of wind, wave and current.

His lordship pointed out that the destructive channel was created on the night of the accident, and that as regards previous damage to the pier by the sea, it was under the extraordinary circumstance of a hurricane, which did not apply in this case.

The jury found that the damage was caused by water from the defendants' culverts, that the defendants had not taken proper precautions in the construction of the culverts to prevent damage to the pier, that the defendants had been negligent in leaving the culverts open, and that the pier was properly protected. It was stated that the parties had agreed to 278*l.* 1*s.* 3*d.* damages, but there being various legal points to be decided, his lordship reserved judgment.

CONTRACTING IN DUBLIN.

ON Monday, the 6th inst., a quarterly meeting of the Dublin Corporation was held, when it was proposed that the report of the markets committee recommending the acceptance of Messrs. William Martin, Son & Co.'s tender for painting work, &c., at the Cattle Market be approved of.

HOWARD & SONS,

25, 26, 27 BERNERS STREET, W.,

MANUFACTURERS BY HAND AND STEAM POWER

OF

PARQUET AND SOLID OAK
FLOORING

Of Finest Quality,

FROM 3*d.* PER FOOT IN OAK.

HOWARD & SONS

Tender for Contracts for any Joiners' Work or Ornamental Plaster. Painting—Plain or Decorative.
Wrought-Iron Work. Stained Cathedral Glass, and any other Interior Work.

An amendment was moved that the report be sent back for further information. Messrs. Martin's firm, it was said, did not employ regular men. They took the cheapest labour they could get, and according to a municipal by-law the Corporation should not give employment to such a house.

The Town Clerk read a letter from Messrs. Martin stating that they were prepared to carry out the contract in accordance with the Corporation specifications, employing regular men and paying the full rate of wages.

A member said they would be in a very awkward position if they sent this report back. If they refused to take that contract now, and gave it to any other person at a shilling more than the sum offered to Messrs. Martin, they would be surcharged.

The Lord Mayor said nothing would be gained by sending back the report, because the committee would not possess any further information than the Council.

The amendment was rejected by 28 votes to 6.

The Lord Mayor said, in order that there might be no misconception on this subject, it would be well for them to see how they stood. They adopted two resolutions, by one of which they accepted the House of Commons rule with reference to the payment of the standard rate of wages in the district, and to see that the contractor observed the proper working hours. Last year they went further by saying that none but regular workmen were to be employed. If that meant that the workmen were to be members of a trade society it meant that all their work must be limited to trades societies. But it might mean the employment of regular workmen, although they did not belong to a society. He did not know how this stood. In the present instance they had a letter from their contractor saying that he would observe the Corporation resolutions. On the other hand, a member of this Council made a statement, on the faith of a communication made to him by the Painters' Society, to the effect that the contractor did not employ regular men or pay regular wages. That was a matter for the Society, and if they could show that the contractor was committing a breach of his contract, it would be for the Corporation to take proper action in the matter, and he had no doubt that the Corporation would take action to enforce their own regulations. The trades societies were devoting their energies to settling the rate of wages and the hours of labour; and here they were in Ireland, while a million a year was spent in England in teaching workmen their work, and practically not one penny was spent for this purpose in

Ireland. Would not the trades societies in Dublin be well employed if they turned their attention a little bit to endeavouring to get expended in this country a proportionate amount in having workmen educated in their business so that they might be able to compete with men elsewhere? Unless something of the kind was done, he was afraid that before ten years they would have to give their contracts to English firms, who, because of the advantage of this subsidy, would beat the Irish houses hollow.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

8402. George Robert Dawney, for "Improved tiles for permanent centreing, to be used in the construction of fireproof floors."

8413. James Burgess Morgan, for "An improved sash-fastener."

8427. Daniel Edward Hipwell, for "A fastener for sliding window-sashes."

8511. Thomas Taylor, for "A new or improved bond or tie for ordinary and cavity walls"

8555. William Howard Daniels, for "An improved sash-fastener."

8700. Jürgen Peter Bruhn, for "Improvements in chimney-tops."

8707. Harry Darwin, for "Improved fittings for doors and the like."

8812. Phillip Bright, for "Improvements in water-closets."

8861. John Frederick Dingle, for "The improved fastener for cords used to ordinary window blind-rollers."

THE

Architect and Contract Reporter.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

CONTRACTS OPEN.

ABERAMAN.—May 27.—For Building Thirty Houses. Mr. G. A. Treharne, Architect, 5 Canon Street, Aberdare.

ABERDARE.—May 29.—For Building Sixty-six Houses. Mr. T. Roderick, Architect, Ashbrook House, Clifton Street, Aberdare.

ABERDEEN.—May 27.—For Pavilion and Bathing Station. Mr. John Rust, City Architect.

AMERSHAM.—June 15.—For Building Villa. Mr. Guest Luckett, Architect, Granville Street, Aylesbury.

ABERYSTWYTH.—May 31.—For Building Four Dwelling-houses. Mr. J. A. Jones, Architect, Plascrug Lodge, Aberystwyth.

BEDWELLTY.—June 1.—For Building Two Board Schools. Mr. W. L. Griffiths, Architect, 27 High Street, Newport, Mon.

BELFAST.—May 30.—For Additions to Lunatic Asylum. Mr. P. J. Tuohy, Board of Control, Custom House, Dublin.

BELFAST.—June 10.—For Construction of Steel Principal Roof at Terminus. Mr. R. B. Belfrage, District Engineer, Belfast.

BELFAST.—May 25.—For Building Stables at Great Northern Railway Company's Goods Depot. Messrs. Young & Mackenzie, Architects, Donegall Square East, Belfast.

BEVERLEY.—May 30.—For Construction of Laundry. Mr. Alfred Beaumont, Beverley.

BEXLEY.—June 12.—For Supply of Glazed Stoneware Pipes. Mr. E. Reeve Boulter, Bexley Heath.

BISHOP'S STORTFORD.—May 25.—For Construction of a Covered Service Reservoir and Cooling Pond, with Valves and Fittings, Boundary Wall and Gates, Additional Well, together with the requisite Rising Main and Fittings for Pumps, Alterations and Repairs to one of the Engines and its Gearing, and Alterations and Additions to the Engine-house. Mr. Wm. Gee, Council Offices, North Street, Bishop's Stortford.

BOSHAM.—May 27.—For Building Board School, &c. Mr. N. C. H. Nisbett, 62 High Street, Winchester.

BOSHAM.—June 7.—For Erection of Board School Offices, Master's House, for School Board, according to Plans by Mr. N. C. H. Nisbett, Winchester. Mr. J. W. Loader Cooper, Clerk to Board, Emsworth.

BRADFORD.—May 24.—For Building Four Houses, Low Moor. Mr. Herbert Hodgson, Architect, 27 Kirkgate, Bradford.

BRIDGEND.—May 27.—For Erection of Two Dwellings and Alterations at the Nash Lighthouses. Mr. C. A. Kent, Trinity House, London.

BRIDGEND.—May 30.—For Construction of Reservoir (1,000,000 Gallons) and Additions to Farm Buildings, Parc Gwylt Asylum. Messrs. Giles, Gough & Trollope, Architects, 28 Craven Street, Charing Cross, W.C.

BRIGHTON.—May 27.—For Preparation, Supply and Delivery of Cast-iron Lamp Pillars and Copper Canopies for Electric Light Arc Lamps, and Iron and Drawn Steel Bracket Posts for suspending the same. Mr. F. J. Tillotson, Town Hall, Brighton.

BROCKLEY.—May 28.—For Supply and Erection of Continuous Wrought-iron Hurdle Fencing and Gates. Mr. H. De la Hooke, L.C.C. Offices, Spring Gardens, S.W.

BROMLEY.—May 28.—For Distempering, Cleansing, Painting, &c., at Sick Asylum. Mr. G. E. Holman, Surveyor, Bromley.

BUCKLAND.—June 1.—For Pulling and Stacking the Materials of Mansion-house recently Destroyed by Fire. Mr. Stephen W. Williams, F.R.I.B.A., Rhayader, Radnorshire.

BUCKS.—June 5.—For Brick and Iron Bridges at Crendon and Ditton Park. Mr. R. J. Thomas, County Surveyor, Aylesbury.

CHEDISTON.—May 25.—For Restoration of Church. Messrs. Bottle & Olley, Architects, 5 Queen Street, Great Yarmouth.

CHISWICK.—May 31.—For Erection of a Postmen's Sorting Office. Messrs. Widnell & Trollope, 13 Parliament Street, S.W.

CITY ROAD.—May 29.—For Pointing, Painting and General External Repairs at the Old Holborn Workhouse. Mr. C. E. Vaughan, F.R.I.B.A., 25 Lowther Arcade, W.C.

DARLINGTON.—May 25.—For Building Parish Schools. Mr. G. Gordon Hoskins, Architect, Northgate, Darlington.

DORKING.—May 30.—For Making-up Two Roads. Mr. G. Somers Matthews, A.M.I.C.E., 35 High Street, Dorking.

DUNDEE.—June 1.—For Building Post Office. Mr. P. Lawrence, 50A Frederick Street, Edinburgh.

EAST RETFORD.—May 31.—For Building Public Baths. Mr. D. J. Kennedy, Borough Surveyor, Retford.

ENFIELD.—May 30.—For Erection of a Block of Schools. Mr. G. E. T. Lawrence, 181 Queen Victoria Street, E.C.

EPSOM.—May 31.—For Excavating a Trench and Laying a 10-inch Permanent Suction-pipe at Waterworks. Mr. Fred W. Hodson, Engineer, Waterworks, Epsom.

FULHAM.—May 30.—For Painting, Distemping and Other Works at Infirmary. Mr. T. Aplin Marsh, Union Offices, Fulham Palace Road, W.

GREENWICH.—May 29.—For Paving Footways and Making-up Roadways in various Streets. Mr. J. Spencer, 141 Greenwich Road, S.E.

HALIFAX.—May 31.—For Building Bank. Messrs. Horsfall & Williams, Architects, 15 George Street, Halifax.

HOLBORN VIADUCT.—May 28.—For Painting the Ironwork of the Bridges on the Viaduct. Mr. H. Montagu Bates, Guildhall.

KILBURN.—June 1.—For Building Ten Cottages. Mr. John West, Chapel Street, Kilburn, Derbyshire.

KIRKBRIDE.—May 25.—For Restoration of Chancel. Mr. G. D. Oliver, Architect, Carlisle.

LISCARD.—May 27.—For Excavating and Forming a Lake in Central Park. Mr. A. Salmon, Public Offices, Egremont, Cheshire.

LEOMINSTER.—June 5.—For Building School and Alterations to Chapel. Mr. E. G. Davies, Architect, 6 St. John Street, Hereford.

LLANDUDNO.—June 17.—For Construction of a Cast-iron 27-inch Diameter Sewer Sea Outfall, Cast-iron Penstocks and other Works and Alterations. Mr. E. Paley Stephenson, A.M.I.C.E., Llandudno.

MANCHESTER.—May 25.—For the Supply of 1,450 Yards 8-inch Cast-Iron Pipe. Mr. T. de Courcy Meade, Town Hall, Manchester.

MANCHESTER.—May 25.—For Supply and Erection of Three Lancashire Boilers. Mr. T. de Courcy Meade, Town Hall, Manchester.

MANCHESTER.—May 31.—For Laying a System of Underground Telephone Pipes, with Brick Inspection Pits, Service Boxes and other Works in several Streets. Mr. Wm. Henry Talbot, Town Hall, Manchester.

MANSFIELD.—June 10.—For Erection of Boundary Walls, Forming and Levelling Ground, Draining Paths, &c., at Cemetery. Mr. R. Frank Vallance, F.S.I., Mansfield.

NEWMARKET.—May 28.—For Enlargement of Post Office. Mr. W. H. Strudwick, Surveyor, 14 Parliament Street, S.W.

NORLAND.—May 29.—For Building Branch Store and Houses. Mr. Medley Hall, Architect, 29 Northgate, Halifax.

PENDERYN.—May 25.—For Restoring Church. Mr. E. M. B. Vaughan, Architect, Cardiff.

READING.—May 27.—For Repairs and Improvements at General Market. Mr. John Bowen, Borough Engineer, Town Hall, Reading.

RIVER THAMES.—June 5.—For Erection and Completion of Three Brick and Iron Bridges. Mr. R. J. Thomas, Exchange Buildings, Aylesbury.

ROMFORD.—June 4.—For Supplying and Laying Norwegian Granite Channelling and Kerbing. Mr. George Bailey, South Street, Romford.

RUGBY.—May 30.—For Construction of Foundations for New Engineering Works. Mr. F. T. Willard, St. Andrew's Church, Rugby.

SOUTHEND.—May 29.—For Laying 1,150 Yards of Sewers and Drains in various Streets. Mr. Harold Harlock, Clarence Road, Southend.

SOUTHEND.—June 5.—For Erection of a Crown Post Office. Messrs. Welsh & Atkinson, 10 Lancaster Place, W.C.

SUFFOLK.—May 24.—For Sinking Two Wells, 6 Feet Diameter and about 25 Feet Deep, and Lining them with Cast-iron Cylinders, Putting Down a 6-inch Borehole in each Well to the Depth of 300 Feet from the Surface, Lined with Borehole Tubes, and Providing Temporary Pumping Plant and Proving the Yield of Water from each Borehole, together with all Pipes, Fittings and other Subsidiary Works, and Construction of Aeration and Filtration Works, consisting of Aerating and Subsidising Tank of a capacity of 50,000 Gallons, Three Sand Filter Beds, Covered Sterilised Water-tank of a Capacity of 50,000 Gallons and Sand-washer, together with all necessary Valves, Pipes and Connections. Messrs. Geo. & Fred. W. Hodson, Engineers, Loughborough.

SWANSEA.—June 20.—For Extension of Dock, Construction of Cofferdam, Railways, &c. Mr. A. O. Schenk, Engineer, Harbour Offices, Swansea.

SWINDON.—May 27.—For Erection of a School to accommodate 885 Children. Mr. W. Drew, Architect, Swindon.

TOTTENHAM.—May 28.—For Providing and Laying 1,100 Feet of Stoneware Pipe Surface-water Sewer. Mr. P. E. Murphy, 712 High Road, Tottenham.

THE LARGEST & BEST VARIETY OF FANLIGHTS & SASH OPENERS, &c., to suit all requirements viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

WINSOR & NEWTON'S

"Waterproof"

INDIAN INK.

SIZE OF BOTTLE, PRICE 1/-

This new preparation—made from genuine Indian Ink—has been introduced to meet the requirements of those Artists, Architects and Designers who wish to lay washes of colour over drawings in ink.

Unlike many so-called Indelible Inks, "Waterproof Indian Ink," when dry, will be found absolutely unaffected by subsequent wetting.

FOR WASHES OF COLOUR USE

TRADE NOTES.

MESSRS. ARCHIBALD SMITH & STEVENS write us under date, May 22:—In your notes under the heading of "Trade Notes" in your current issue, you mention some lifts which have been erected at Wellington Court, which have one or two features connected with them which are of interest. It would rather imply that the makers of these lifts were the only ones who had these points of interest. We may mention that we are making and have done for some time variable power lifts, and that owing to the extreme sensitiveness of our safety-gear, which has never failed—out of some hundreds erected—an idle rope mentioned by your representative is not required, as our safety apparatus comes into action immediately one of the ropes stretches. In justice to ourselves and the general public we should be much obliged if you would kindly mention this in your next issue."

WE hear that Messrs. E. H. Shorland & Brother, of Manchester, have just supplied some of their patent Manchester grates to the Woodhouse Schools for the Normanton School Board, the patent Manchester stoves previously supplied having proved very satisfactory.

MESSRS. CROWDEN & GARROD, of 62 Southwark Street, are the London agents for the "Eclipse" sanitary sink and drain cover (Howse's patent). It entirely prevents solid matters passing down drain-pipes, &c., and is invaluable for the kitchen sink. Liquids, by passing over the sanitary blocks, are impregnated with a sufficiency of such, so as to act as a perfect deodorant and disinfectant on passing into the drain-pipes, &c. Poisonous gases, foul smells, &c., emanating from drains, &c., rendered entirely innocuous by reason of their contact with the sanitary block, which is suspended immediately over such drain.

WE have to inform our readers that Messrs. Dixon & Corbitt and R. S. Newall & Co., Limited, have transferred their London offices from 30 Great St. Helen's, E.C., to 130 Strand, W.C. This is a return to the offices of the old firm of R. S. Newall & Co., where the company carried on business for the past fifty years.

VARIETIES.

THE death is announced in Albany, N.Y., of Mr. John B. Halcott, who, as an architect, had a large practice over nearly all the eastern part of the country.

AT a special meeting of the Airdrie Town Council Mr. Charles Brown was appointed burgh surveyor.

OWING to insufficient accommodation for the manufacture of gas in Perth it is proposed to move the works to the sand island at the shore. The outlay for removal, new plant, &c., is estimated at about 25,000*l*.

WE understand that the name of Mr. Herbert J. Thurgood, F.S.I., of 27 Chancery Lane, has been added by the Board of Trade to their list from which selection is made when it falls to the Board to appoint a surveyor to act in arbitration cases; and that Mr. Thurgood was last week also appointed surveyor by the Surrey County Council to act under the new Finance Act with reference to death duties.

THE *Leeds Mercury* says that some Manchester capitalists have formed a company, with a capital of 20,000*l*., for purchasing the Gorsey Hill and Stoney Hey estates, comprising the loftiest eminence in the Wallasey district at New Brighton, which commands a magnificent view of the Rock Channel, the approaches to the Mersey and Dee, and the Snowdon and the Carnarvonshire ranges. It is intended to erect a tower on the

summit of the hill. The grounds will be laid out on the lines of Belle Vue at Manchester and the Douglas Pavilions and Pleasure Grounds, and provision is to be made for a football ground, surrounded by a racing and cycling track. The company has secured the services of Mr. Huon A. Matear, of Birkdale, to develop the undertaking.

A REPORT by Sir William Arrol on the condition of the suspension bridge at Dumfries has been received by Mr. Grierson, the town clerk. He says the bridge is quite strong and safe for any ordinary traffic that can be brought upon it, and the condition of the ironwork, so far as its present state of preservation is concerned, is very fair, and with care and some painting would be satisfactory. So far as he could see, the only defective parts of the bridge are the floor and wind-bracing, which he proposes should be renewed. Owing to its great length compared with its breadth it required to be well braced laterally, and by renewing the floor in the way suggested it would help to stiffen the structure against wind pressure. He also suggests that all iron be cleaned where necessary and painted, special attention being given to the roller-bearings on the tops of columns and band-ties where they enter the ground.

A COTTON warehouse at Bootle, owned by Alderman J. Webster, of Manchester, and stocked with over 4,000 bales of cotton belonging to Messrs. Paton & Maclaren, was destroyed by fire on Wednesday morning, the damage being estimated at between 40,000l. and 50,000l. The goods and building are insured.

THE Spanish Government have invited tenders to be sent in before June 17 for the construction of a quay in Gijon Bay and for deepening the river Aviles. Particulars may be seen at the Commercial Department of the Foreign Office.

THE Lincoln Architectural Association will hold their annual meeting this year at Stamford, on Wednesday and Thursday, June 19 and 20. On the first day an excursion will be made to Duddington, Tixover, Barrowden, Harringworth, Lyddington (where there are the remains of the Bishop's Palace), Seaton, Morcott, North Luffenham, Edith Weston and Empingham. On the second day a visit will be made to Barnack, Bainton, Ufford and Wittering, the six churches and other places of antiquarian interest in the town of Stamford, beginning with St. Mary's Church, and afterwards those who wish to do so will visit Burghley House, near Stamford.

ELECTRICAL.

IN Berlin a curious effect was noticed in the electric train during a thunderstorm at night. All the electric lamps inside and outside the carriages were extinguished every time it lightened, and the passengers remained a few moments in complete darkness. Then the lamps rekindled.

THE *Engineering Record* of New York says that with the opening of this month a United States mail street-car service was begun in Boston. Upon six routes centering at Post Office Square cars are run upon a regular schedule, receiving in some cases incoming mail at the railway stations and receiving from and delivering to substations and carriers in the suburbs. Another route between Dorchester and North Cambridge carries mail between stations and does not come to the central post-office. The cars used are old horse-cars rebuilt and mounted on electric trucks. The two end doors in the old cars were permanently closed and new doors were cut in either side near one end, but without steps or handles to invite accident. Inside the car is equipped with sorting tables and racks like a railway post-office. Nine incandescent lights illuminate the interior and a chemical fire-extinguisher is supplied each car. Speaking-tubes allow of communication with the motor-man and conductor. The end platforms are closed by automatic locking gates and carry a fender and an electric bull's-eye lantern. The cars are painted white and have a slot for mailing letters in transit on each side. Both motor-man and conductor are supplied by the street railway company, the latter to see that schedule time is made as well as to manipulate the trolley rope.

BUILDING AND BUILDERS.

THE *Glasgow Herald* says:—Various builders have already shown their desire to take advantage of the proposed alteration of the building regulations. At the meeting of the Burgh Police Commissioners it was decided by a majority that application should be made to the sheriff for power to alter Article 12 of the building rules annexed to the Burgh Police (Scotland) Act, 1892, so that builders might be enabled to erect tenements with their mean and mutual gables a few inches less in thickness than the statute meantime admits of.

ON Saturday a fire occurred at Plymouth at Mr. S. A. Roach's marble and slate works, an extensive block of buildings

being destroyed, and damage done to the amount of over 40,000*l*. The stock included about 50,000 builders' laths, and the whole of these, with a large quantity of slate, marble and other material, were destroyed. About forty men are thrown out of employment.

THE *Engineering Record* of New York says Mr. John Rome, one of the best known builders in Brooklyn, N.Y., died May 5. Early in the '60's he rebuilt the walls of the *Eagle* newspaper building without disturbing the occupation and constant use of the structure, and he is said to have been the first builder in the country to attempt this kind of work.

THE *Scientific American* says the Sage House, Brooklyn and St. Mark's Avenues, Brooklyn, N.Y., has been successfully moved by B. C. Miller & Son, the house movers of that city. The building is of stone, weighing about 1,300 tons, and was built by a son of Mr. Russell Sage, of New York. The contract for removal called for its being moved 30 feet toward St. Mark's Avenue and 20½ feet toward Brooklyn Avenue, and that it should be raised 2½ feet on its foundations. This to be done without break or crack in the walls.

At the Paisley Dean of Guild Court plans of additional bath premises in Storrie Street were approved of. The principal additions are a new swimming pond, 75 feet by 40 feet, and several warm baths. The total cost is estimated at 5,302*l*, exclusive of the purchase price of several properties to clear a site.

At the meeting of the Bath Board of Guardians a motion that a committee should be appointed to report on the protection from fire arrangements at the workhouse was negatived.

AN inquiry has been held at Crewe respecting an application of the Corporation to borrow 8,000*l*. to build an isolation hospital.

NEW CATALOGUES.

WE have received from Messrs. Morrison, Ingram & Co., of the Hygeia Works, Cornbrook, Manchester, their excellent illustrated catalogue and price list of sanitary appliances, comprising lavatories, baths, water-closets, urinals, sinks and plumbers' brass and ironwork, as manufactured by them. The section devoted to lavatories is particularly interesting, and one-third of a large catalogue containing 180 pages has been devoted to lavatories. The compiler of the catalogue has

devised a most handy mode of indexing, there being for each section a numerical index, and also a pictorial index of typical appliances. As the manufacture has been made the subject of much attention by Messrs. Morrison, Ingram & Co., we think it of interest to give their own account. They say:—"The advent of our patent D lavatory marked a new era in lavatory work, and revolutionised the lavatory trade. The old order of things has happily passed away, and our sanitary lavatory system obtains instead. It is only bare justice to ourselves to indicate the fact, and it proves the initial soundness of our principle, the pioneer of a system. The chief novel features of our well-known and now famous D lavatory—still pre-eminently the best—are the arrangement of taps and inlet, the conformation of bowl, giving great comfort to the user, and the successful introduction of the sanitary soap and brush trays. But further developments have lately been introduced, to which attention may be directed, viz the Club or Hotel Lavozone, Louis XV., and Era lavatories; also our new patterns of school lavatories. The pages are intended to represent the extent and variety of our present lavatory designs, and how far we are capable of executing orders for almost any class of work. But we are ever willing to adapt these patterns where practicable, and work specially to the designs of architects and others. It has been our privilege to be consulted by some of the leading architects in the country, to prepare plans and specifications of important lavatory and other schemes of sanitary fittings, and to carry out the same with the best possible results. It therefore affords us pleasure to know that our suggestions have proved so acceptable to our clients; indeed, this department has become an increasing feature in our business." About forty pages are devoted to baths and their fittings. The baths are of all kinds, and among them a specially good type are the patent steamless and noiseless baths. The section for plumbers' brasswork has received much attention, and an endless variety of fittings is shown. Their regular productions consist of yellow metal, gun-metal, hygeia white metal and bronze metal, all composed of the best materials. We may direct attention to their hygeia white metal, which is dense and tough, and capable of taking and retaining a lustrous silvery polish, while the price is not more than brass nickel-plated. The section 4 is an exhaustive one as regards closets, urinals, sinks, &c. We can recommend the catalogue for reference, as such a variety of choice is afforded. We cannot conclude without calling attention to the many and excellent coloured plates interspersed in the volume.

NEW HIGH SCHOOL FOR GIRLS, DUNDEE.

A GALLIC TRIUMPH.

LIBRARY, THURLAND CASTLE, KIRKBY LONSDALE.

IMPERIAL MARBLE COMPANY, LIMITED.

On the 16th inst. an exhibition of the productions of this syndicate was held at Winchester House, and some beautiful specimens of marbles were shown. By the Moreau-Rae process, to which we had occasion to refer in our issue of March 16, 1894, limestone is chemically metamorphosed into marble of the finest quality, which is indistinguishable from that which is prepared in nature's laboratory. This result is brought about by the following means:—

The object to be converted into marble is first cut in the soft stone, and is shaped, worked, or carved (as the case may be)—is in fact completed so far as all machine and mason's labour is concerned. It is then immersed in a bath or several baths of metallic solutions, where it receives its colour or colours. In some cases where it is desired to produce particular markings or veinings, the object is first partially coated with a thin varnish. This varnish is laid on the surface of water, where it assumes lines and patches more or less in accordance with the intention of the operator, but being on so unstable an element as water a very pleasing freedom of design is obtained. The object is then brought in contact with the varnish, which instantly adheres thereto. It is then dried. Being thus marked here and there with veins and patches of varnish which is impermeable, it is dipped in the baths, each of which produces its own distinctive colour, the metallic solutions penetrating the pores of the stone wherever the varnish is not. It is transferred from bath to bath where many shades of colour are required, and the various solutions blend and overlap each other. The colouring solutions having entered the stone, which they do in the space of a few minutes, the object is dipped in a bath of warm water, which expels all the air and drives the colouring solution to the very heart of the stone very rapidly, and penetration being complete the result is an object in coloured limestone, which being dried is ready for conversion into marble. At this stage it is possible, if desired, to superadd

other colouring solutions, but it is rarely that this is required, as the effect that will be produced by immersion in any colouring bath for a given space of time is accurately gauged. The colouring now being completed and the object dried, it is immersed in an indurating bath, where the conversion into marble is completed. In this bath the object becomes of the consistency, approximate density and specific gravity of marble; in fact it becomes marble. Where the objects to be treated are large, they are taken out of the hardening baths after certain intervals and immersed in warm or cold water (as the case may be), which drives the hardening solution to the centre of the stone, leaving the surfaces in a condition to absorb more of the hardening solution and to insure uniform and complete penetration. The increase of density in the stone depends greatly on its structure, but in soft stones an object after treatment gains some 30 per cent. of its weight, and that without suffering the slightest change in shape or increase or diminution of bulk. By this simple process actual marble is produced, which after polishing in the ordinary manner is available for all purposes of architectural construction and decoration, for which, owing to its comparative inexpensiveness, it will no doubt be largely employed. It has already been used with admirable effect at the Niagara Hall Skating Rink.

THE HOUSING OF THE WORKING CLASSES IN LIVERPOOL.

A CONSIDERABLE quantity of property certified by the medical officer for health as being unfit for habitation has been destroyed in Liverpool, but very few of the vacant spaces, says the *Liverpool Courier*, caused by the demolition of these houses have been utilised. A sub-committee of the insanitary property and artisans' dwellings committee of the City Council was elected to consider the subject of providing dwellings for the working classes on this vacant land. This sub-committee, of which Councillor Burgess was chairman, has just made its report, which has been submitted to a meeting of the insanitary property committee. In the course of this report the sub-committee expressed the opinion that the results of the practice of selling vacant sites to builders for the erection thereon of cottages for the labouring classes were not entirely satisfactory, from the point of view of providing accommodation for the class of people accustomed to live in court houses, the houses erected being let at rentals too high

HILL'S

JAMES HILL & CO., 100a QUEEN VICTORIA STREET, LONDON, E.C.

for these persons to pay. In order the better to enable a comparison to be made between the rents of the new cottages and those of houses such as the committee demolished, it should be stated that the usual rent of a court house was from 2s 6d. to 3s. per week, and of those fronting streets and with their backs to the courts, from 3s. 6d. to 4s. per week. The sub-committee therefore recommended that the Corporation should retain some sites in their own hands when they became vacant under the twelfth presentment, and erect thereon suitable tenement dwellings or cottages to produce such low rentals as would give a fair return to the Corporation upon the cost of the buildings and the value of the land, and provide a sinking fund for the repayment of the moneys borrowed, the value of the land being taken at the price it would fetch if sold to builders of cottage property. The sub-committee were of opinion that it was desirable that the persons displaced should be rehoused as soon as possible in sanitary dwellings erected upon the sites of the houses demolished or adjacent thereto, but at the same time they thought it advisable to point out that, owing to the crowded state of the land upon which the insanitary houses stood, it was quite impossible to provide upon any given site accommodation for the same number of persons displaced therefrom, having regard to the due requirements for light and air. With regard to any large area which might be acquired under the Housing of the Working Classes Act, 1890, it might perhaps be possible to provide accommodation for the whole of the population displaced, in large high blocks of dwellings similar to those in Victoria Square and Juvenal Street, but the sub-committee were of opinion that this class of dwelling should not exceed three storeys in height, in which case the whole population displaced could not be provided for. The sub-committee therefore recommended that in any future application to the Local Government Board for a loan, either for the purpose of demolishing or erecting houses, the Board should be informed that the Corporation had an objection to the erection of buildings of more than three storeys in height, and that in their opinion it was impossible to rehouse the population in ordinary cottages or tenement dwelling-houses of not exceeding three storeys in height, and that even if it were possible it would not be advisable to do so, having regard to the density of the population in Liverpool, which exceeded that of any other large town in the United Kingdom. The following were the conclusions which had been arrived at by the sub-committee:—(1) That

the Corporation should, on the first plot of land coming into their possession convenient for the purpose, erect dwellings suitable for the accommodation of the class of persons at present living in court houses. 2. That these dwellings should, as a general rule, be either self-contained houses of two storeys in height, or houses built upon the "flat" system, and containing one, two, or three rooms in each tenement, with, in some cases, the addition of a scullery. 3. That if a sufficient number of dwellings were built to make it worth while to do so, a man should be appointed to supervise and undertake the letting of a certain number within a given area, and collect the rents from the tenants. 4. That as far as possible in letting new dwellings provided by the Corporation preference should be given to persons who had hitherto occupied the demolished or other court houses.

The suggestions of the sub-committee will receive careful consideration.

HARTWOOD LUNATIC ASYLUM.

THE lunatic asylum which has been erected at Hartwood for the Lanark District Lunacy Board has been opened by Sir Windham C. Anstruther, the chairman. The asylum has been built upon the estate of Hartwood, which was purchased by the Lanark District Lunacy Board in 1889, and stands near the western boundary of the estate, to the northward of the Caledonian Railway Company's main line between Edinburgh and Glasgow. The land extends to over 600 acres, and is undulating in character, ranging from 490 feet to 828 feet above the level of the sea. The buildings, which were designed by Mr. J. L. Murray, Heavyside, Biggar, are Scottish Gothic in style. They are built in the pavilion form, and the chief feature consists of two battlemented towers in the central block. The general ground-floor stands at an elevation of 655 feet, the whole of the front commanding a fine view of the surrounding district. The total area is about 10 acres, the extreme length along the front from east to west being 850 feet, and from north to south 470 feet. The central block of the buildings consists of the administrative department. On the ground-floor there are the dining-hall, to accommodate 600 patients, besides attendants, between which and the kitchen there are a commodious serving corridor, the kitchen, 60 feet by 40 feet, with sculleries, dish-rooms, stores and attendants' dining-room, and immediately behind this the

general store. Above the dining-hall on the first floor is the recreation-hall, capable of seating comfortably 1,200 persons. On either side of the administrative block are the male and female sections of the asylum, the male side being to the east. The male official block, consisting of three storeys, adjoins the administrative, and contains the accommodation for the male staff of the asylum. The next block on the front, two storeys in height, consists of the male senile wards, and adjoining this to the east are the male hospital wards. The corresponding buildings to the west of the administrative section accommodate the female staff and the senile and hospital female patients. Running north from behind the front buildings on either side are the male and female acute blocks, consisting of two storeys, and are upon the same floor level as the front. Still further to the north on either side are the male and female chronic blocks, consisting of three storeys, the ground floor of these being at a 10-feet higher level. These blocks stand at an angle to the other buildings, so as to give the fronts a southern exposure, and immediately opposite these blocks on the other side of the connecting corridors are the chronic bath rooms and attendants' recreation-rooms. The whole of these blocks are connected with each other by glazed corridors, 8 feet in width, the total length of corridors thus employed being 1,072 feet. The blocks are thus isolated, minimising the risk of fire, besides securing a better lighting of the whole buildings. On the male side, immediately behind the administrative block, are the workshops, consisting of bakery, joiners', shoemakers', tailors', upholsterers', painters' and plumbers' shops, and adjoining are large coal stores, fire station and mortuary. On the female side also behind the administrative is situated the laundry block, consisting of the boiler-house, engine-room, wash-house, laundry, receiving, sorting and delivery-rooms. Detached to the east of the asylum, at some little distance, is the medical superintendent's house, and to the south of the main line of railway are several blocks of attendants' cottages, and the main entrance gateway and lodge. Besides the erection of these buildings a large amount of work had to be executed in forming the branch railway from the main line to the asylum, preparing the site for the buildings, forming reservoirs for water-supply, and in laying out the grounds, necessitating the removal of about 290,000 cubic yards of earth. The whole of the building materials had to be brought by rail, as no proper stone for the buildings could be got upon the land; and for this purpose there have been used about 75,000 tons. The whole asylum buildings are warmed throughout with mild hot water,

this being heated in sections by means of steam supplied from one central boiler, and the baths, lavatories, kitchens and sculleries are also supplied with hot water in the same manner, the heat being capable of being turned off or reduced on any block at will. The return steam or condensed water is taken back to the boilers, thus saving all loss of water, and also saving fuel through the hot water being returned to the boilers. The steam-pipes, steam-heaters and connecting-pipes are placed in roomy subways underneath the buildings, by which means all unnecessary traffic in the wards of the asylum for repairs is prevented. In carrying out the system of steam and water pipes connected with the asylum there is a total length of 16,689 yards, or nearly 9½ miles of pipes. The buildings, including the doctor's house, are lighted with electricity, generated from the engine-room. There is a gross boiler-power of 750 horse, with an engine-power of 200 horse indicated given off by three horizontal compound engines. There are altogether 1,260 lamps, varying from 8 to 100 candle-power each, giving a total candle-power of 21,964, requiring 137 horse-power to light the whole. Besides the generating plant there are ample storage batteries, capable of sustaining the light during the night. In the event of any breakdown in the generating plant, one of the engines and dynamos will be at rest and ready for use if such were to happen. The whole of the blocks, together with the doctor's house, railway station and farm steading, have been, or are being, connected by telephone to each other for convenience of administration. For the proper supply of water to the institution the advice of Mr. James Gale, C.E., given to the Glasgow District Board of Lunacy in 1883, has been followed. A dietetic reservoir has been formed to the north of the asylum at a top-water level of 711 feet O.S.D. It is supplied by springs and has a catchment area of 144 acres, the greater part of which has been newly cross-tile drained 2 feet deep and led into the reservoir. The area is composed of hill pasture and is free from any peaty soil. The available rainfall, taken at 15 inches per annum, gives a supply during the year upon this ground equal to 223 gallons per head per day for 600 inmates. The reservoir as formed covers an area of nearly 4 acres, and is 9 feet deep. It has an available storage capacity of 8,280,000 gallons, which alone would give a supply for 180 days for 600 inmates at the rate of 76½ gallons per head per day. The water from this reservoir to the asylum is passed through ample filter-beds, having a total superficial area of 2,340 feet. For the supply of water for flushing and fire-extinguishing pur-

poses a reservoir has been constructed at an elevation of 779 feet O.S.D. This reservoir is supplied from a catchment area of about 60 acres, chiefly peat moss, and with 15 inches available rainfall has a supply equal to 93 gallons per head per day for 600 inmates. This reservoir covers an area of about 2½ acres, and varies in depth from 4 feet to 11 feet. It has a storage capacity of 5,044,000 gallons, which gives a supply for 180 days for 600 inmates at the rate of 46 gallons per head per day. The drainage of the asylum has been carefully arranged upon approved principles, and carried out in substantial manner, the sewage being conducted to filtrating depositing tanks to the south of the main line, the liquid sewage being utilised in irrigation below this point. The buildings are ventilated in every part by natural ventilation. With regard to the interior finishings, one special feature in regard to the asylum is that the whole plasterwork has been finished in Keene's cement upon a ground-work of Portland cement, thereby obtaining a beautifully-polished surface, and greatly lessens the risk of the lodgment of germs and reduces the risk of breakage. The whole of the wood floors have been laid in pitch pine, and the lower walls, where not lined with tiles, are lined with pitch-pine also in 3-inch widths. A number of specially-designed fittings have been adopted throughout the asylum, such as locks, sash-openers, bath-fittings and screens, store-bins, &c., and also in the arrangement of the kitchen cooking apparatus. For the protection of the patients the whole main line along the front of the asylum and up the western boundary to the lower reservoir and round both reservoirs has been fenced by a 7-feet high unclimbable iron fence, and besides this there have been erected about 9,000 yards of galvanised iron and wire-fencing. The excavations in forming the railway and preparing the site were commenced on June 23, 1889, and the first stone of the buildings was laid on May 17, 1890. The whole buildings have thus been completed three days within five years.

VENTILATION OF HOSPITALS.

AN article on "The Ventilation of Hospitals and the Treatment of Infected Air" appears in our contemporary, the *Lancet*, in which are discussed in considerable detail the arrangements for ventilation which are being carried out at the new General Hospital, Birmingham, arrangements which have recently been the subject of vehement anonymous attack. The *Lancet* says:—"In no other buildings is it more essential or

vital that ventilation should be efficient and conducive to comfort and to health than in those set apart for the tending and nursing of the sick. Most of our large hospitals were founded at a time when methods of ventilation and sanitation were crude; but even in hospitals of comparatively modern construction, in which the sanitary arrangements may be perfect so far as regards the removal of effete liquid and solid products, there will generally be found much that can be done to improve the satisfactory displacement of vitiated air and the means of providing a fresh and pure supply. The importance of such a provision is doubly emphasised when we consider, as experience has shown, how beneficially the free and open atmosphere ministers to the healing of wounds and to the elimination of morbid conditions. No apology is needed, therefore, if we lay before our readers the details of so important a departure in regard to the construction of one of our large provincial hospitals as the installation of a new method of ventilation, which, we venture to think, is far in advance of any scheme which has hitherto come under our observation, and more particularly because not only does it provide for the efficient and salutary ventilation of hospitals, but also for the treatment, if need be by means of antiseptics, or purification of the vitiated air of the wards before it passes into the outer atmosphere. For the present, however, we will confine ourselves to the method from the point of view of ventilation only, and in a succeeding section we will describe how this system may, by the simplest, and, we think, most effective, manner be employed for the treatment of vitiated air with the important view of preventing the spread of infection from such buildings as smallpox and scarlet-fever hospitals. For this purpose we cannot do better than take as an illustration the new General Hospital, now in course of erection in Birmingham, which, by the courtesy of the architect, Mr. William Henman, we have recently had an opportunity of inspecting. Let it be understood that in doing so we are not dealing with a system that has merely been projected, but with one that has already been carried into practice in several infirmaries and other buildings, schools, police courts, and the like, and which, as we have just said, has actually been provided for in the plans of one of our great hospitals. The building operations, indeed, at the new General Hospital, Birmingham, are so far advanced as to afford a clear idea and plan of the installation which is to effect the ventilation of the hospital." The article then briefly reviews the systems of ventilation which are available, and points out broadly the advantages of the

propulsion system. The method of its application and the installation at the new General Hospital, Birmingham, are then described. The method of ventilation adopted is primarily due to Mr. William Key, an engineer of Glasgow. "In applying the Key scheme to a hospital a selection is first made of a position, uncontaminated by surroundings (or of more than one such position if the buildings are extensive), where air can be drawn in towards an extended screen, kept moistened with water and periodically flushed to free it from the large amount of dirt which it intercepts. The screen is formed of a series of cocoanut-fibre cords stretched vertically and interlaced with copper wire to keep them in position. On the outer side a coil of steam or hot-water pipes is placed to prevent freezing in the winter, and on the inside are other heating coils arranged so that by means of doors or louvres the air passing through or under them may be regulated. It is then forced onward by means of a rotary fan or air-propeller, set in motion by steam, water, gas, or other power—preferably an electric motor—and finds its way to the several rooms, wards or corridors by means of a wide and lofty horizontal duct and up flues, all calculated to the required areas, at the base of which are more heating coils, together with a simple contrivance by which both the volume and temperature of the air-supply to any separate part of the buildings can be adjusted to a nicety. The air enters where required by means of trumpet-mouthed openings, at about two-thirds the height of the storey, so as to disperse evenly throughout the apartment; and at the same time it expels an equal amount of air, principally through openings provided on the same side of the room as the inlets, up flues of the proper sectional area, into ducts in the roof, and thence to the open, through valved and louvred turrets or flaps, four-sided, so that outer movement of the atmosphere shall exert no adverse influence upon the outflow. These outlet air-valves are so constructed as to place the air within the building under a slight pressure of about four ounces per square foot in excess of the outside atmospheric pressure at the time. In the new General Hospital at Birmingham an installation has been provided for heating and ventilating the buildings, the cubical capacity of which equals about 2,000,000 feet; so that, as the air may be changed ten times per hour without opening any windows, 20,000,000 feet of air every hour has to be propelled, cleansed and warmed; for which purpose there will be eight 'fans,' from 6 to 8 feet diameter, to be turned by electric motors, 2,000 superficial feet of cleansing screen and about 35,000 feet of steam tubing."

After referring to some of the remarkable effects produced upon the air by the purifying screens above referred to, the article proceeds:—"It was the important purifying property of the screen just alluded to which led Mr. William Henman to suggest that the outgoing air, after being vitiated or infected by patients, might again be purified, so far as regards infection, by the use of similar screens at the outlets. This project is so important in connection with the construction and site of infectious diseases hospitals as to merit very serious consideration and attention at the hands of the profession and others who are interested in the subject. Mr. Henman considers that in fever hospitals each block of buildings should be separately supplied with an air intake, screen, heating-coils and fan, which in a building of only one storey may be arranged in the roof space. Mr. Henman takes no credit for the method by which a suitable supply of air is cleansed, tempered, humidified and propelled into the buildings, but acknowledges his indebtedness to Mr. Key for the assistance he has rendered in working out his ideas in connection with the methods he adopts. It is simply proposed that air so cleansed, tempered and humidified should be propelled through narrow, wedge-shaped openings in the ceilings, and by means of a simple form of spreader evenly distributed throughout the wards and corridors. The feature which Mr. Henman claims to be a novelty is the placing of a screen (somewhat similar to those employed by Mr. Key at the air-intake) at the head of every bed, and keeping the same charged with a disinfecting fluid. An outlet flue will be provided at the back of each screen, so that as fresh air is constantly being propelled into the ward an equal quantity will be forced through the screens, all other outlets being stopped; consequently almost immediately the air becomes contaminated it will again be purified, even before it actually leaves the apartment, and thus purified will pass up the flues and into the open air. A very simple contrivance is employed for keeping the screens constantly charged with disinfecting fluid, so as to obviate disturbance to the patients in the wards, and reduce personal attention to the least possible limits. The disinfecting fluid found to be perfectly effective in destroying disease germs is a weak solution of carbolic acid. Above and below each screen a shallow trough is placed, the upper and lower ones respectively being united by lead piping, carried to any convenient position outside the wards, each connected to a cistern of moderate dimensions to which a small pump is attached, so that as the fluid flows along the upper pipe and trickles down the screens the surplus is caught in the

No. 3—THE SELF-HELP FASTENER.

A large number already in present use giving full satisfaction. Unrivalled. you require them for single or for double casements.

COMBINED STAYS AND FASTENERS FOR CASEMENTS AND FANLIGHTS.

WE beg to call your special attention to our Patent Combined Stay and Fastener, which, from its great advantages and easy mode of use, can well claim a superiority over the common kinds. You will notice that this Fastener has no complex system of working, is easy to fix, and, whether the casement is open or shut, does not project into the room, but hangs down the centre of the sash free from curtain or blind. The advantage of this Patent Fastener is that, being fixed in the centre of the sash, it affords protection against sudden gusts of wind when open, and keeps the sash safely closed when shut, as it acts as a fastener for the casement as well as a stay. Each of the three kinds of Fasteners affords the same advantages in all respects, as, though varying in shape, size, and price, are only different ideas of the same method. These Casement Fasteners can be used both for wood or iron, for single or double casements. The special pattern is used for fanlights to open outwards, and all can be used both for right or left hand. We can supply these Fasteners in any number of links, according to the extent the casement is required to be opened. We may also note that the Fasteners are well made and finished, can be had both in brass and iron, and are, therefore, well suited for any kind of residence. Quotations and further information will be given on application. Also testimonials. Please state in ordering whether

Portable Cistern Filters.

lower troughs and returned through the other pipe to the lower cistern, whence it is pumped to the upper one. This may be made practically automatic by applying to the pump the same motive power used for turning the fan which propels fresh air into the building, and by having a third cistern or reservoir with regulated supply to make up for loss of fluid by evaporation from the screens. There can be little doubt of the efficacy of the screens in removing micro-organisms, in view of the indications afforded by a series of very searching and exhaustive experiments carried out under the direction of Dr. Sims Woodhead and Dr. Cartwright. The results of this investigation may be summed up as follows:—(1) Micro-organisms are entrapped by passing air through moistened screens. (2) The apparatus employed in the experiments in which dust loaded with organisms was forced through an experimental screen into a wooden chamber, from which samples of the air were taken from time to time for bacteriological analysis, gave in all probability less perfect results than would occur in practice, because in these experiments the air, highly charged with micro-organisms, was both forced directly through the screens and also by force drawn through them, whereas in buildings the air would be propelled gently through the screens simply by the slight pressure of the incoming air, no suctional force whatever being employed. (3) The very marked diminution in the number of micro-organisms which passed through the screens when supported by means of perforated zinc, and the smaller number still which pass through a thin layer of cotton wool, indicate varying powers of filtration, and point to the possibility of devising a screen which will practically free the air from germs and yet not unduly retard the expulsion of the air from the building. (4) In proportion to the closeness of texture of the screen material, the size of the screens must be increased so that the air may pass through them with the least possible force being required to expel it. (5) The moistened screens are all that is required to arrest the germs, but carbolic acid should be added for destroying them. (6) Disease germs or fungi likely to be conveyed by the atmosphere are usually found attached to comparatively large floating particles, as the scales of the epidermis, or fluffy shreds of material which would be entrapped by the screens in greater proportion than the germs experimented with. In accordance with the suggestion contained in paragraph 3, that better results might be expected by the use of finer screens, yet of ample size to permit of the passage of air, a building has been erected in which these suggestions can be adopted, and tests will shortly be made exactly on the same

lines as when the screens are employed for the purification of air emitted from hospitals. It is probable, again, that the passage of large volumes of warm air through the screens would volatilise a considerable quantity of the disinfecting fluid with which the screens will be constantly charged, and that any germs which might not be entrapped by the screens would thereby be quickly deprived of vitality, and, moreover, that the mere reduction of the number of germs would be a considerable safeguard, because the attenuation of germs, as is well known, lessens the severity of their effects.

As regards the cost of the method proposed, the necessary apparatus is stated to be quite inexpensive and easily applied, and Mr. Henman is prepared to show that buildings can be erected and equipped at considerably less cost than is now expended upon hospitals relying only upon the ordinary means for ventilation, without any appliance for purifying the air emitted. More space for the patients has been the demand for some time, which, beyond a given area known to be necessary for nursing purposes, in reality means more air. It is very naturally asked, where, with such a constant change of air, is the necessity for more space within the hospital than is required for tending the patients? It is contended that with suitable appliances by which the air can be constantly and quickly changed, as in Mr. Key's method of ventilation, buildings might be less in cubical capacity by at least one-third; and not only would this reduction in size more than compensate for the cost of apparatus and its working, but the daily labour and charges for heating, lighting, cleaning, administration and maintenance would be proportionately less. Another point of importance is that those who tend the patients would be constantly in a pure atmosphere, for no sooner is the air vitiated by contact with the patients than it is at once purified and expelled.

The Key method of ventilation has met with very distinct success where it has already been installed, as, for instance, at the Victoria Infirmary, just mentioned, in several schools, and in other public buildings,* and the results of its adaptation to a large general hospital such as that in course of erection in Birmingham will be watched with very great interest, the

* Mr. Key's method has been applied already to four hospitals or infirmaries, to some twenty-four large schools, and to several other large buildings, as cloth factories, police courts, public libraries, and so on, while further installations are being provided for in fifteen similar buildings at the present time.

completion of this admirably-designed building being expected in about two years' time. The practicability of the method, however, is obvious. The important proposal of the architect, Mr. Henman, to disinfect the outgoing air of infected wards where the Key method of ventilation is in force has, of course, not yet been put to practical test; but there is good ground for believing, as we have already shown, that this important adjunct to Mr. Key's method of applying the propulsion system of ventilation may offer a really satisfactory solution of that difficult question of how to make infectious-diseases hospitals safe to the surrounding neighbourhood. At any rate, the method, with its proposed augmentation, is of sufficient importance and scientific merit to demand the careful and serious consideration of all those interested in the vital questions of the ventilation and the purification of the air emitted from infected buildings. We congratulate the authorities at Birmingham on the trouble and care they are taking to provide and equip a hospital fully in accordance with the requirements of modern scientific research, and we trust that other communities which may be brought face to face with a similar problem will evince an equal share of anxiety to attain so admirable and worthy an end.

TRAMWAY WORKING.

THE Leeds Corporation are desirous of working the tramways taken over from a company on a system that will differ from what is employed. Accordingly inquiry was made in several towns respecting various systems. The following abstract of the report has appeared in the *Leeds Mercury* :—

The System at Darlaston and Walsall.

With reference to the electrical overhead tramways at Darlaston and Walsall, which were inspected in September and October, 1893, the report explains that the system there in operation differs from that of the Thomson-Houston Company on Roundhay Road. At Darlaston the posts and wires are on one side of the road only, with one wire for single track and two for passing places and double lines. The promoters claimed this feature to be superior to the corresponding part of the Thomson-Houston system, and the claim seemed to be a just one, as no wires crossed the streets and many less guy wires were required to pass round corners. Another noticeable feature was the double-decked car in use. The next tramways

to which the report refers are those at Newcastle-on-Tyne, consisting of fourteen miles of single track. These are worked by horse traction, and are let to a company on a lease, five years of which have yet to run. The Corporation, to whom the lines belong, have had an offer from a company to secure the remainder of the lease on condition that a cable system be adopted, and are now applying to the Board of Trade for a provisional order to enable them to apply the cable system to a considerable portion of the lines. Whilst this is the fact, says the report, it would appear from the public press that the Council have not come to a final conclusion with regard to the cable system, as at their meeting on December 5 last the statutory resolution of the Council to proceed with the application for a provisional order was only carried by a majority of one, two members not voting. The provisional order was further discussed by the Council on January 17, and on a motion that the provisional order for the tramways of Newcastle be not proceeded with in the ensuing session of Parliament, the voting was twenty-five for and twenty-seven against, and three did not vote. The provisional order is therefore being proceeded with.

The Cable in Edinburgh.

From Newcastle the committee went to Edinburgh, where the Corporation took over the tramways about a year and a half ago. In 1887 the Edinburgh Northern Tramways Company, who are tramway builders, made an offer to the Corporation to lay the cable along what are known as the Trinity and the Stockbridge routes. This was accepted. The Trinity route is a double line $1\frac{1}{2}$ miles long, with gradients which vary from 1 in 11 to 1 in 60, the total height ascended being 187 feet. Along this track are eighteen curves, one less than a right angle. The Stockbridge route is $1\frac{1}{2}$ miles of double line, on which the steepest gradient is 1 in 13, and the total rise 173 feet. It is almost entirely a series of curves over steep and very narrow roads. The diameter of the cable is 1.03 inches, and the weight five tons per mile. The lines are equipped for a three-minutes' service. The published accounts of the company for 1893 showed that the expenditure, including motive power, traffic, maintenance and general charges, amounted to 6.38d. per car-mile. The tramways worked satisfactorily both on the steep inclines and on the level. In an interview with the Lord Provost and several members of the tramways committee the deputation were informed that the Corporation had not contemplated the adoption of the overhead electric system. It was pointed out that Edinburgh was a great historical city,

visited annually by thousands of tourists from all parts of the world; that its face was so much its fortune that it could not afford to risk disfigurement of the streets by poles and wires. With regard to cost, it was stated that they (the tramways committee) were informed that the initial expenditure on the cable system was exceptionally large, and that heavy traffic and an average three-minutes' service were essential for its success. They further stated that the additional slot rail necessarily created some difficulty for horses drawing heavy loads in getting proper foothold. The engineer added that where the traffic was heavy and the gradients 1 in 16 and 1 in 21 or thereabouts, congestion and serious difficulty would arise unless the streets were sufficiently widened to allow two vehicles to pass each other on each side of the tramway without having to pass over the slot rail, and it might be that the slot rail would require to be specially chequered on the upper surface. The magistrates and Council, however, have resolved to proceed with the cabling of the main trunk lines within the city.

Glasgow Undecided.

Glasgow was next visited. The Corporation of that city had fully considered the question of tramway traction, and their general conclusion appeared to be that horse haulage should there be discontinued as soon as possible; that compressed air, oil and gas motors had not been so far perfected as to make their adoption practicable, and that the city was well suited for the cable. The overhead electric system was objectionable for the heart of the city on account of its unsightliness, though it might do in the outskirts. The city authorities, however, had not arrived at a definite opinion as to the merits of the cable and overhead electric systems respectively. They believed that each had a merit, and that the special circumstances of the routes should be carefully considered before determining which system should be adopted.

Electricity in the Isle of Man.

The report also gives some details relating to the Brixton cable tramways, $2\frac{3}{4}$ miles double track. Here the cable is $3\frac{1}{2}$ inches in circumference, 30,000 feet long and weighs 30 tons. The service is the extraordinarily quick one of $1\frac{1}{2}$ minutes and the traffic phenomenal. The steepest gradient is about 1 in 22. The speed allowed is about 8 miles an hour, which they work up to as nearly as possible. The Isle of Man Tramways, which were inspected in August last, consist of a line of horse tramways along the promenade at Douglas, about 2 miles in

length, and a double line of electric tramways 7 miles long, being 14 miles of single track. This system is overhead, but instead of the trolley, a collector bar is used on each end of each car, the patent of Dr. John Hopkinson. It is, in fact, a railway and not a tramway. An important feature is the "cut-out" switches which are provided at certain points along the line, about three-quarters of a mile apart, with the result that in case of a breakdown by failure of current, &c., the section between the two "cut-outs" only is affected. There are two generating stations, one at Douglas and one at Laxey, each end of the route. Another specialty is the accumulator station at Groudle, which contains a battery of 240 cells. From this station 100 horse-power can be supplied for $4\frac{1}{2}$ hours, or 50 horse-power for ten hours. Sometimes the company have supplied as much as 150 horse-power for a short time from this station. The cells are always automatically charging or discharging, according to whether the generating station is making sufficient electricity or not for the motors running on the lines. This arrangement of storing surplus power enables the company to run their engines and dynamos at nearly full load for the whole of the day, and in this regard effects a saving in the consumption of fuel. The cells are of a new type (the chloride), and it is claimed for them there is only a loss of electricity of about 20 per cent., and that this is more than covered by the increased saving in coal and wear and tear of plant.

Brussels and Havre Accept Overhead Wires.

At Brussels the committee found a very complete and well laid out sample of the Thomson-Houston overhead system. There are two lines electrically operated, having a total length of about nineteen miles, and a total of thirty-five motor cars, each one of which takes a trail car. Before the introduction of the electric system a large portion of the line was worked by steam, and although the municipal authorities at Brussels opposed very strongly the introduction of the overhead wires, yet the Belgian Government and public opinion caused them to give way, and the satisfaction now given is very great. Inside the town itself the overhead wires are mostly fixed on steel posts with arms carrying the trolley, so that there is very little cross suspension. Outside the town, in places, wooden posts are used. The trolley wire is cut into sections electrically so as to separate each quarter mile. This is a great convenience, and enables repairs and other work to be done without affecting the general working of the line, and is of much importance in case of fires along the route. The feeders are

carried under the ground, and are tapped into the trolley wire at frequent intervals, thus keeping the pressure very constant. Lightning arresters are used along the line, and have proved useful in several severe storms. The electric system fulfils the requirements of the public much better than the steam trains. At present the electric cars run every fifteen minutes in each direction. In the city itself the service is much more rapid, cars following one another at intervals of four minutes. The increase of traffic since the lines have been opened is very considerable, amounting to 100 per cent. Along parts of the road the speed reaches sixteen miles an hour, and the gradients are steep, amounting in one case to 1 in 16. The actual cost of traction (power and maintenance) is 1'79d. per car mile for one concern, and 2'78d. for the other line.

At Havre is one of the most complete examples in Europe of electric traction on the Thomson-Houston overhead system. The whole of the network of the Havre trams, which was originally operated by horses, is now electrically equipped. There are forty motor cars, each divided into first and second class, and each car has a carrying capacity of fifty passengers. The cars are fitted up in very good style. They run smoothly and quietly, and are lighted electrically. In the narrow streets the wires are suspended over the track by cross wires of steel, fixed in some cases to ornamental brackets let into the walls of the house, and in other cases by steel posts. In the broader boulevards there are centre posts with ornamental arms on each side carrying the trolley wire, and electric lamps are placed on the top of every other post. The effect is extremely good. The posts are 29 feet long, sunk into the ground 6 feet 6 inches. There are about 560. Of this number 85 have arc lamps on them lighting about 4½ miles of thoroughfare. The equipment of the lines was completed in July last, but in September the number of passengers carried was double that in the corresponding month of the previous year, when horse traction was used, and the contractor's guarantees as to running costs were, it was stated, more than realised. The actual cost of traction per car-mile is 3'37d., and the receipts 11'2d.

The Roundhay Tramway.

Some interesting details with respect to the working of the Roundhay Tramway on the Thomson-Houston system are likewise given. The installation consists of a generating station at Burmantofts, where engines and dynamos are placed capable of giving out 180 effective horse-power. The electrical horse-power required for a whole working day averages twelve

per car. There are five cars running. Each of the cars is fitted up with two 15 horse-power electrical motors. The difference between the actual horse-power required to work a car and the horse-power fitted to a car is caused by the power required to start the car on the severest gradient. This difference also accounts for the generating power at the station having to be so much in excess of the average requirements of the cars. This drawback has been lately largely surmounted by improvement in the electrical machinery on the cars. The weight of the motor car is 6½ tons. Those now being built are 5 tons. On busy days the motor car commonly pulls a trail car. The whole of the wires are overhead, supported by poles placed against the edging stones. The cars run about 7½ minutes' service. The installation was commenced on October 29, 1891. Since that time not a single wire has been broken or an accident or inconvenience suffered by any one by reason of the installation being an electric one. The accounts in accordance with the terms of the concession have been regularly audited by the Corporation auditor. It is claimed for this tramway that, like all other electric overhead installations, the traffic has increased more than it would have done by any other system. For the year ending November 10, 1892, the passengers numbered 720,069; from November 11, 1892, to August 28, 1893, 659,376; and for the year ending August 28, 1894, 931,055.

Relative Cost.

The cable in Birmingham cost in 1893 for 3½ minutes' service 6 32d. per car mile, not including capital and rearrangement expenses. The Roundhay electric for the last twelve months, 7 to 8 minutes' service, cost 5'76d. per car mile. Management and power station expenses include 71d. and 65d. per car-mile. In the large installation contemplated, this will be reduced 21d. and 32d. respectively, and the cost would then be 5'23d. Ordinary repairs on 35 miles single track, at 50d. per mile, on 2,429,084 miles, 17d., making the total cost per car-mile 5'40d.

Conclusions.

After considering the engineer's report most exhaustively, comparing it with the notes previously made by them, and reviewing the whole case, the committee have come to the conclusion that the present dual system of haulage, viz. by steam and horse-power, should be superseded; that oil, gas and compressed air are at present impracticable; and that having regard to the many different routes in Leeds and the total

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled, either inside or outside with our Trade Mark—"The Anchor."

length thereof, the varying requirements of each route as to frequency of service, and the fact that the steep gradients are here uncommon, they are unanimously of opinion and recommend to the highways committee that electrical traction is the most suitable for the tramways of this city. They have not failed to consider the advantages of cable where the gradients are commonly steep and the streets mainly narrow, nor that cable is specially remunerative where the routes are short and thickly populated, thus rendering a frequent service practicable on all the lines equally; but these advantages only apply to Leeds to a very limited extent; and, on the whole, the committee's preference is decidedly in favour of electric traction, with overhead wires except in the centre of the city—say, from the junction of Briggate with Boar Lane to the Dispensary in North Street, to the junction of Hunslet Lane with Hunslet New Road, to Queen Street in Wellington Street and to the top of Park Row, and that within these limits an electric conduit system should be adopted. They do not close their eyes to the fact that objections may be made to both the overhead and conduit systems of electric traction, and that it will no doubt be contended by some that the former will seriously disfigure the streets. This, however, is not considered an insuperable objection, and moreover it is believed that great improvements can be made in regard to them by placing the feeder wires underground, and also by dispensing with many of the poles by fixing wires and apparatus to buildings (power to do which is being asked for in the Bill before Parliament), and possibly by placing such poles as are necessary against buildings (instead of at the causeway edge) in some cases, and in other cases in the centre of the roads rather than on both sides thereof. At the same time it may be practicable to utilise these posts for electric lighting by arc lamps, greatly to the advantage of the districts in which they may be placed.

Overhead electric traction will also avoid the danger to vehicular traffic caused by the extra metals required to form the slot along each of the two tracks for cable traction, it being impracticable in many parts of the city to allow the width of two passing vehicles on each side of the tramway. This difficulty will not, of course, be removed where the conduit system of electricity operates, which, however, would only cover about $2\frac{3}{4}$ miles in the centre of the city, where the streets are fairly level and of good width, out of the total of present and intended tramways of forty-one miles. The committee specially point out that whilst they are of opinion that the electric system has passed the experimental stage, it has doubtless not yet reached

the maximum of its possible advantages. Improvements are anticipated, particularly in regard to accumulators, which will be a great advance on the overhead system. This is a matter of considerable importance, as the capital expenditure upon electric traction will be much smaller than upon the cable system, and in case of any alteration, or the subsequent adoption of a new method of traction, will result in less loss than would be sustained by a change from cable haulage to that of any other.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

VARIETIES.

AT Market Harborough an inquiry has been held in regard of the application of the Urban District Council to borrow 2,500*l.* for the purchase of the police-station and premises at Little Bowden, for municipal buildings, &c.

A POLL of the inhabitants of Brentford, on the question of the erection of public baths in the town, has shown that a large majority are in favour of their erection.

THE *Engineering Record*, New York, records the death of Mr. Alexander Marshall in Pittsburg. He was educated as an engineer, and before coming to America was engaged in land reclamation work in Ireland, and on railways in Wales, Belgium and Russia.

THE same journal also announces the recent death of Mr. E. B. Cox, past president of the American Society of Mechanical Engineers, at the age of fifty-six years.

THE *Glasgow Herald* says:—The committee of the Glasgow Mauchline Society have issued a circular soliciting subscriptions amounting to 2,000*l.* or 3,000*l.* for the erection of cottage homes as a memorial of Burns on a site very near Mossiel Farm. There is to be accommodation for six free tenants, who must belong to the respectable and deserving class.

THE Paris correspondent of the *Standard* says:—The report of M. Picard, the Commissary-General of the Universal Exhibition of 1900, has just been communicated to the Press. It is a very long document, describing the main features of the coming international show. It will cover about 97 acres of ground, and have its principal entrance on the Cours la Reine, Champs-Élysées. The cost is estimated at 100,000,000 francs, of which 20,625,000 francs are put down for the palaces and other minor constructions in the Champs-Élysées, and 24,320,000 francs for the palaces and constructions on the Esplanade des Invalides, the quays, the Champ de Mars and the Trocadéro.

THE work of constructing a new lake contiguous to the river Clwyd at Rhyl, which has been in progress for the past twelve months, entered upon its final stage when the valves of one of the culverts were opened, and water allowed to enter the lake for the first time, in the presence of the members of the Council and many of the general public.

THE *Daily News* says the Victoria Embankment is now again open from end to end. It has been blocked in sections ever since the break-up of the great frost, and its repair has been an exceptionally heavy undertaking. The road presents a surface of 48,000 square yards, and to keep it in repair costs on an average 3,000*l.* a year.

THE Calverly School Board propose to build new schools and make additions and improvements to others at Farsley, near Leeds.

THE works committee of the Dundee Town Council have discussed the subject of new buildings in regard of premature occupation. The burgh engineer has been instructed to prepare draft by-laws relative to the premature occupation of new buildings and kindred matters applicable to buildings both new and old.

**ART PLATES FROM "THE ARCHITECT."**

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing.

VILLA RESIDENCE, STOURWOOD, BOSCOMBE.

PROPOSED COTTAGES, WEST BRIGHTON.

TRADE NOTES.

THE contract for the third section of the Belfast Corporation's water scheme, the price being 140,000*l.*, has been secured by Mr. Alexander Gall, contractor, Alloa.

AS requested by the Ayr Town Council, Mr. John Eaglesham has submitted plans and specifications of a proposed new drainage scheme for Ayr. The estimated cost is 33,405*l.*, of which sum 11,051*l.* is for main concentration sewers or outfalls, which may be largely dispensed with.

THE new Sanatorium, Tunbridge Wells, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves with descending smoke-flues, patent Manchester grates, patent exhaust roof-ventilators and vertical inlet tubes, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

ELECTRICAL.

THE Ayr Town Council have agreed to extend the trunk wires to Alloway Place and Miller Road, which are beyond the compulsory area, and resolved to introduce the electric light into the municipal buildings.

THE electric light is to be adopted at Windlestone Hall, co. Durham, the seat of Sir W. and Lady Eden.

A SCHEME for the construction of an electric railway between Derby and Ashbourne is being prepared. The towns are only thirteen miles apart by road, but the present route by the North Staffordshire Railway is thirty miles. The new line would make the famous Dovedale more accessible.

AT a meeting of the Chester electric-lighting committee it was resolved to recommend the Council to accept the contract of Messrs. Parker, Limited, of Wolverhampton, to provide the city with an installation of the electric light, and to proceed with the work at once.

BUILDING AND BUILDERS.

IN connection with the Leighton Buzzard water and sewerage works the foundation-stone of the water tower was laid on the 23rd inst. by Mr. W. S. Page, J.P., chairman of the Urban District Council. At the ceremony a silver trowel, suitably inscribed, with gavel, was presented by the engineer, Mr. H. Bertram Nichols, A.M.I.C.E., of Birmingham. The ground floor of the tower will contain, besides the two engines for raising the water from the well to the tank above, two engines and air-compressors for actuating the ejectors in connection with the sewerage system. The contractors for the works are Messrs. Garlick & Horton, Limited, of 43 Sloane Street, London, S.W.

THE Ayr Town Council have decided to extend the Esplanade footpath to the head of the Low Green, and to build a wall to protect the Green at the part where it suffered from the storm in December last.

THE strike in the Leicester building trades, though now in its ninth week, so far as carpenters and joiners are concerned, shows no prospect of settlement. The plumbers are still locked out, and they decline to return to work on the terms offered, although promised all that they demanded within a week of resuming work. The builders, bricklayers, plasterers and slaters have up to the present declined to accede to the demand for a general strike, but all building operations are being seriously interfered with, and the employers threaten to introduce non-union labour.

AN inquiry has been held at Sowerby Bridge as to an application to borrow 6,000*l.* for gasworks extension on the present site. This is a modified scheme, taking the place of a much more costly one known locally as the Holmes scheme. Mr. R. W. Evans, clerk for the district council, stated that they thought the scheme contemplated adequate for some years to come. They were about to carry out a sewage scheme at an estimated cost of 20,000*l.*, and they thought it inopportune to undertake a large gasworks extension in addition. The storage capacity would be increased from 395,000 to 637,000 cubic feet.

AT Westhoughton preparations have been commenced for putting in the foundations for the new church of the Sacred Heart at Sylfield, Westhoughton, the contract for erecting which has been given to Messrs. E. & D. Maginnis, of Bolton. Mr. Thomas Burgess, of Haigh, is the architect.

MINING SUBSIDENCES IN THE BLACK COUNTRY.

DURING the last few weeks, says the *Birmingham Post*, there has again been brought prominently before the public the wholesale damage to property by mining operations within that portion of the Black Country subject to those extraordinary specimens of the legislative wisdom of the period when George III. was king, known as the "Dudley Wood and Pensnett Chase Enclosure Acts." The agitation in favour of some redress, or a limitation of the extent of possible future damage, has this time been set in motion by the District Council and the property-owners of Quarry Bank, where a most serious and painful state of things has been brought about by mining operations. Here and there outside walls are either bulged in or are cracked from basement to roof, window-frames are distorted into all sorts of fantastic shapes, ceilings are "bagged," floors are "raised," and, in not a few instances, roofs are laid open to the sky. The demolition of property has been greatest, and has perhaps entailed the largest amount of suffering, at Stour Hill, where no less than seventy families have of their own accord made good their flight from the impending danger or have received notice from Lord Dudley's agent to leave their houses to avoid personal injury. The misfortune falls upon these tenants unexpectedly, as a general impression had hitherto prevailed that, owing to an up-throw fault, as well as former mining operations, the neighbourhood of Stour Hill was safe for building purposes, and this, probably, accounts for the greater amount of property here compared with any other area of similar size in the parish. The geological structure of the neighbourhood points, it is said, to a more disastrous result than has ever been experienced in the district from any previous mining operations, and the surveyor to the District Council anticipates that over 30,000*l.* worth of property will be ultimately affected, in which case there must be a general exodus of the inhabitants, and a thriving little township will sink into decay.

Quarry Bank has suffered severely, and is likely to be subjected to further hardships. Only a short time ago the Dudley Town Council received a communication from Sir Benjamin Hingley, M.P., respecting the dangerous condition of no less than sixty houses in one street at Netherton, which, he stated, he was not prepared to guarantee "standing for an hour." The investigations of the borough surveyor showed that Sir Benjamin's fears were only too well-founded, and the possibility of

the whole of these tenements collapsing or disappearing into the bowels of the earth whilst occupied roused the Council to a sense of their responsibility in the matter, with the result that all the tenants received notice to quit. Unfortunately, the houses in Griffin Street, where the tenants were subjected to this form of eviction, were only a type of the condition of the majority of dwellings in this thickly-populated district, constituting as it does a veritable town in ruins, so general are the evidences of wreckage and damage. Dwellings intact are almost a novelty, except in a few streets where residences have had to be rebuilt, or in the very rare instances where the mines have been purchased by the property-owners. To these exceptions must be added a number of secure-looking houses on an eminence in the locality, which are sometimes pointed out to the inquirer as the effects of the determined opposition to the Enclosure Acts by a property-owner who was living at the time they received Parliamentary sanction. Extending to Primrose Hill and Darby End a scene of wholesale wreckage and dilapidation exists, the living-rooms in several instances having sunk to such an extent as to make it easy for a pedestrian to gaze into the bedrooms, some of which are just on a level with the thoroughfares. At Brockmoor, Pensnett, Hart's Hill, Woodside, Old Hill and other neighbouring places much the same condition of things exists, although, perhaps, not to such a serious extent as at Quarry Bank and Netherton. The kitchen floor of a house at Brockmoor suddenly collapsed some time ago, depositing several of the inmates in the cellar, but, happily, no loss of life resulted. The process of destruction is slow and sure; but it is exceedingly rare for a house to completely collapse without plenty of warning being given, to which fact is mainly attributable the comparatively insignificant amount of personal injury sustained by the occupants. The owners of the damaged property are for the most part people in humble circumstances, to many of whom the ruthless rending asunder of bricks and mortar has involved the loss of a life's earnings, whilst to not a few it has meant utter ruin. At the time of the passing of the Acts most of the land which is now densely populated lay waste. The mines underneath it were supposed to belong to the lord of the manor, and, according to the promoters of the Acts, it was then found to be almost impossible to work them without some reservations. The property owners, with few exceptions, consented to the provisions of the Enclosure Acts. The measures not only gave the lord of the manor power to do anything he liked with the coal underneath the enclosed areas; but, as is stated

WASH-DOWN COMBINATION CLOSET. SILENT AND SURE.

SHANKS' PATENT SILENT "COMBINATION" CLOSETS AND CISTERNS.

A New Departure.

CISTERN AND CLOSET COMBINED IN ONE COMPLETE COMPACT PIECE.

The valve outlet from cistern, which is six times the size of ordinary outlets, is connected directly with the inlet to Closet, which is correspondingly large. The instantaneous character of the flush FULLY compensates for the lack of height, and renders the Closet really superior to those with overhead cistern. Made also with syphon cistern.

The one here shown is of the wash-down type, constructed of strong white enamelled fireclay with embossed ornament, as shown.

The Closet is strong, simple, and sanitary, easily fitted, and of fine appearance.

Prices and other particulars on application.

in the preamble of the Bills, he was entitled to "soil underneath the common water, land and other things." The Acts enabled the lord of the manor and his lessees to work the mines without being liable to compensation; but, as a kind of set-off to those almost unrestricted privileges, there is a clause stating that they must "do as little damage as may be." It is true the Acts propose a method by which compensation may be obtained, but it is surrounded by insurmountable difficulties. The clause dealing with this matter states, in effect, that any person suffering from mining operations may bring his grievance before two justices of the peace, and on his proving that damage has been done they could make a rate on all the colliery-owners on the Chase to the amount of the damage, including the cost of making and collecting the rate. With but one exception this piece of machinery for obtaining redress has never been set in motion. In 1858 one "Jerry Thomings" endeavoured to put the rating provisions of the Act into force, but the colliery proprietors opposed tooth-and-nail the granting of the rate by the justices, rendering it necessary for an application to be made to the Court of Queen's Bench for a mandamus to compel the justices to sign the rate. The mandamus was obtained, and the owners then appealed to the Quarter Sessions against the rate. Jerry was again successful, but his legal triumphs do not appear to have done him much good. Some say that the rate being confirmed the persistent Jerry was about to collect it, when the opposing parties, who were threatening a still further appeal to the higher courts, made an offer of a compromise by payment of a lump sum, which on the advice of his friends he accepted; whilst others affirm that the rate having been levied, it was discovered at the last moment that the machinery indispensable to collecting it was wanting, and that the whole case collapsed, swamping poor Thomings in heavy law costs. The attitude of the colliery proprietors with regard to the rate has not changed in the least, and the property owner who would undertake the task of enforcing this method of redress would be confronted with the same or even more determined opposition than that with which Thomings had to contend. But the obstacles which surround litigation were slight compared with those which would have to be encountered if litigation were resorted to as a remedy for existing evils. It is seriously argued and not without a considerable amount of force, that if an Act was passed compelling all mine-owners to compensate for surface damage the aggregate demand would be so enormous that the only alternative would be the closing of the mines. Assuming this contention to be correct, the result would be

that a large proportion of the 'people would be thrown out of employment, because other important industries would suffer by the closing of the mines, and with the decline of local trade and the houses and works tenanted the last state would be worse than the first. It is, however, the opinion of many in favour of compulsory compensation, that owing to the value of the coal still remaining means would be devised to extract it without so much damage to the surface as at present, and that even if this were impracticable the average colliery proprietor would after making ample reparation and meeting all expenses, including royalties, still leave a respectable surplus for profit.

Apart from the overwhelming legal difficulties surrounding the matter, the whole question of compensation is beset with great and conflicting interests. On the one hand, there are the interests of the miners, the ironworkers, and the interests of all who desire that the collieries of the district should be worked thoroughly; and on the other hand, the interests of the owners of the houses. Indeed, the more the question of legislative compensation is considered, the greater appears to be the difficulty of constructing any general scheme which would deal out even-handed justice all round. If redress, either by litigation or legislation, is impracticable, what then are the people who now suffer by the damage caused by mining operations under the Enclosure Acts to do? In other parts of the district outside the areas of the Acts, and where the lord of the manor is subject to common law, the custom is for his lordship to erect a new house for every one destroyed. The varied character of the lessees, and the disparity of the conditions under which some of the mines are worked, make it hopeless to expect that so complete an act of reparation as that referred to will ever be generally adopted within the enclosed areas. Some arrangement, however, might be arrived at between the owners of the collieries and property owners, by which the former might agree to contribute a proportion of the cost of keeping damaged houses in repair, and in cases where they are completely destroyed afford facilities for the re-erection of cottages on land free from mining operations. The property owners might put their grievances into definite shape, and a private Bill might be carried through Parliament compelling all colliery owners to abstain from removing ribs and pillars, and also an undue clearance above and below them, the inevitable effect of which would be to minimise the extent of future damage. A Government inquiry into the working of the Acts might also have a beneficial effect. The Earl of

Dudley, who in his speech at Worcester practically admitted his moral obligation, has shown himself to be of a generous disposition, and it is not at all improbable that if his attention could be closely drawn to the wholesale wreckage to property, something would be done to alleviate extreme cases. The whole question is again exercising the minds of those interested, and the time appears to be ripe when something should be done, if not to provide some substantial redress, at least to limit the extent of damage in the future.

CEDAR FORESTS IN ALGERIA.

THE Government of Algeria, says Consul-General Playfair, in his last report, is anxious to direct public attention to the forests of the colony, especially to those of cedar and cork oak. It has published two brochures on the subject which are beautifully illustrated and contain much valuable information. The first of these treats of one of the most attractive features of the mountainous regions in the departments of Algiers and Constantine, a never failing source of interest and pleasure to the traveller, but hitherto of no great commercial importance.

The cedar of the Atlas is a variety of that of Lebanon, *Cedrus Libani*, var. *Atlantica*. It occurs at an altitude of from 4,000 to 6,000 feet above the level of the sea, in the Aurès Mountains; in the Belezma, near Batna; at Ben Thaleb, south of Setif; in Babor and Ta Babort, between Bougie and Djidjelly; in which locality it is associated with a magnificent conifer, peculiar to Algeria, the Atlantic *Pinsapo*, *Abies Pinsapo*, var. *Baborensis* (Cosson). In the Department of Algiers it is found in the Djurdjura range; on the hills above Blida; in the Ouaransenis and at Teniet-el-Ahd. Many Alpine plants are associated with it, such as the *Taxus*, *Ilex*, *Prunus*, *Sorbus*, *Juniperus* and *Rhamnus*, various species of oak and flowers of great beauty.

The forest of Teniet-el-Ahd, being easy of access, was treated in the most ruthless manner by the military in bygone days, before the Forest Department was properly organised. Trees were cut down and allowed to perish on the spot. Dead wood and dry grass produced fires which threatened the very existence of the forest, and the Arabs were in the habit of burning the old grass to produce fresh pasturage for their flocks. Now the utmost care is taken of this forest, and its regeneration is rapidly taking place. Young trees are everywhere springing up, and though wood of average dimensions is

still insufficient, that is a want which will disappear in time. The foregoing remarks apply more or less to every other cedar forest in Algeria.

Great destruction took place in the forests prior to 1884, owing it is said to unusual and excessive drought, and in a great measure to the attacks of caterpillars. I may quote my own observations regarding this destruction of cedar trees, written in 1875. "We passed through woods and clumps of cedars in which there were more dead than living trees, some still erect, others torn up by the roots, bearing evidence to the violence of the storms which prevail here in winter. These become more and more mixed with living trees as the traveller descends, till the dense forests on the lower slopes (of Chellia) are reached. But even here destruction is doing its work, principally owing to numerous communities of hairy processional caterpillars, which spin a web-like nest on the higher branches, destroying all vegetable life as their ravages descend."

I cannot state from personal observation what the present condition of the forests in the Aurès Mountains may be; I have not visited them since the foregoing was written; but that of Djebel Touggourt, a favourite excursion of tourists from Batna, is in a most deplorable state, and it looks as if it might almost cease to exist in twenty years hence. The whole surface is covered with trees which have been torn up and allowed to perish; very few young trees are springing up; caterpillars are everywhere at work, and there seems, to the casual observer at least, to be no efficient supervision. It is calculated that there are 35,000 dead trees still standing, and one person has purchased the right to cut these down within two years, and to supply 100,000 railway sleepers for the Est-Algérien line.

The ruinous system of granting forest concessions, which formerly existed, has ceased. The trees are now felled by the Forest Department, and the timber is sold by public auction. The quantity thus disposed of in 1892-94 was as follows:—

Year.	Quantity sold.	Amount realised.
	Cubic mètres.	Francs.
1892	10,506	48,000
1893	6,173	25,070
1894	10,983	41,820

Cedar-wood is said to be somewhat less enduring and

elastic than pine from the north of Europe, and therefore requires a rather larger scantling when used for architectural purposes; but these objections have been found to exist more especially in timber containing the heart of the tree. Now its nature is better known than it used to be, the heart is generally employed for railway sleepers, and the outside portions for carpentry. Sleepers thus made have been found to last from eight to ten years, and to require no injection; it has also been employed with good results for wood pavement and shingles. But it is especially for cabinet-making and decorative purposes that cedar-wood is most valuable, and for such purposes it is advisable to saw the wood so as to get rid of the heart altogether, and to cut up the outside portion so as best to display its beautiful and irregular veining.

This is best explained by the annexed plate. The heart is first removed by two cuts of the saw. This is again divided into three sections—1, 2, 3. No. 1 can only be used for railway sleepers. The rest of the timber is sawn up as indicated

in the plate, according to the appearance of the wood, its veining, colouration, or the purpose for which it is required.

The forest of Teniet-el-Ahd has an area of 2,325 acres, and it contains a considerable number of trees that might fairly be used; but to regard it only in the light of a source of revenue would be unworthy of the Government; the giants of the forest there are of incomparable beauty and incalculable artistic value. This forest is a favourite resort of travellers, and it is gratifying to know that the Government is resolved to exploit it only in the most legitimate manner by a system of rotation, so as not to destroy its great beauty.

The means at present employed of felling the trees and cutting up the timber by hand is too expensive. There is not sufficient water-power to drive a saw-mill, and there is no other resource but to employ steam-power. Till that is done, and means of communication are improved, the cedar forests can hardly be expected to prove remunerative. But the amount of timber available in the various forests is so great, that when these difficulties are overcome, it will be a source of great riches to the colony.

LEVEN BRIDGES AS INVESTMENTS.

A CORRESPONDENT of the *Glasgow Herald* supplies the following remarkable account of the profits which are to be derived from bridges in rural districts:—

Wednesday, the 15th inst., will be a red-letter day in the annals of the Vale of Leven. At noon on that date the pontages on the bridges at Bonhill and Balloch ceased, after having been levied for well-nigh sixty years. Patiently have the inhabitants borne the tax—a tax which to many families became in the course of the year a second rent. But although patiently borne, the impost was invariably paid with reluctance and a feeling of injustice. The amount levied during these years at Bonhill Bridge could not be less than 80,000*l.* In a public record it is stated that from the time of the erection of the bridge down to the year 1882, Mr. Smollett, the proprietor, had received—over and above the cost of the erection, and every disbursement connected therewith—a sum of 30,000*l.*, and in 1884 he was awarded 28,000*l.* as compensation money in lieu of any rights he possessed. The first cost of the bridge was only 2,200*l.*, and few investments have yielded such a return. Fifty years ago the combined annual income of both bridges was under 500*l.*; when last put up to auction they commanded 2,450*l.* As already stated, although the tax was borne patiently, there was always an under-feeling of injustice at the imposition. At intervals during these sixty years this under-current came periodically to the surface. To understand how this feeling was engendered it is necessary to study “the bridge question,” as it is locally designated. Prior to 1836 transit over the river was effected by ferry boats—a tedious and at times dangerous mode of conveyance. When the river was swollen and the current strong it was no uncommon experience for the chain of the boat to snap. This meant either a casualty or a journey down the river for the occupants. Under the Act of 1807 the Road

Trustees had special powers to erect a bridge, but failed to meet the needs of a growing population. In 1828 these powers were renewed and strengthened, but the trustees remained dormant. In 1833 a petition signed by 1,300 inhabitants was presented to Admiral Smollett, of Bonhill, the proprietor of the ferry rights, craving him to substitute a bridge for the now inadequate ferry. The Admiral took the matter up, was authorised by the Commissioners to erect, but on account of some informality he abandoned the idea. It has been held that at this time (1833) the Commissioners, in granting the authority they seem to have granted to Admiral Smollett, were acting *ultra vires*, and this opinion is strengthened when it is seen that the following year, in 1834, they received statutory powers to contract with the proprietor of the ferry for the erection of a bridge "on an assignation to the tolls and duties until the trustees should redeem the right so assigned by making payment to the proprietor of the value of the bridge erected, together with the value of the ferry." This limitation of the pontages, at any rate, was not a stipulation of the previous Act. Admiral Smollett came forward again, and intimated that he was prepared to erect a bridge under the Commissioners' previous warrant. This was confirmed, and the handsome "suspension" which does duty to-day was built. By allowing the erection of the bridge in this way it did not seem to strike the Commissioners that they were laying on the inhabitants what appeared to be a perpetual burden. It might, on the other hand, have turned out a bad speculation for Smollett, and had the public refused to pay pontages Smollett would have had difficulty in proving his title. As it was, the public felt the benefit of the bridge, and gave recognition thereof to the proprietor. About the year 1850, however, some enterprising inhabitant who digested the circumstances of the pontages came to the conclusion that the dues could not be enforced, and put his opinion to a practical test. The task of "walking the bridge free" was conferred upon one Steel, an advocate, who made a successful *début* and met with no opposition. But the public, instead of giving Smollett the opportunity of suing them, became themselves the aggressors in litigation, summoning the proprietor in 1852 for an accounting of the pontages. The action was taken up entirely on erroneous grounds, and the plaintiffs retired defeated. The general feeling is that the Road Trustees at this period were very lax in the matter, and by the powers which they possessed might have enforced an accounting and abolished the pontages. Enthusiasm seems to have died out

until 1878, when an Act for the vesting of certain bridges in Road Trustees and for the cessation of pontages was before Parliament. Some dubiety existed in the minds of the community as to whether or not Bonhill and Balloch Bridges would come within the scope of the Act, and accordingly a letter was sent to (then) Mr. Arch. Orr-Ewing, M.P. for the county, praying for their inclusion. This was effected, and some years later arbitration proceedings began in connection with the amount of compensation to be paid to the proprietors of the bridges in question. A movement was also initiated with a view of collecting the necessary arbitration amount and settling the "vexed question" once for all. But this movement proved abortive, save that it was the means of raising several separate sums, amounting in all to about 100*l.*, and which has only now been utilised. It was at the time of this movement that the feeling of the people against the pontages took the form of a riot. It is, indeed, the only "bridge riot" worth citing. A public meeting regarding the impost was dispersing from Alexandria Public Hall. A large contingent had been present from Bonhill, and naturally in crossing the collector came in for "remark." It only wanted a spark to set the crowd "ablaze." Some words by the collector and the interference of the police led to a general tumult. It was an opportune hour for such an occurrence—11 P.M. The heads of the collector and officers of the law were the targets for anything and everything, from a "divut" to a brickbat, and matters got so warm for these gentlemen that they accepted the inevitable and beat a hasty retreat. Demolition followed. The gates were wrung from their hinges and cast overboard; the suspension swayed like a tightrope. Advocates of the imposition were held in a state of suspended animation over the parapet and narrowly escaped a ducking. The bridge box was broken into fragments, and the booty—one shilling—was presented to a boy who had been most energetic in the devastation. Continuing the history, the necessary amount was not subscribed, and there was nothing for it but to pay out the proprietor—28,000*l.* for Bonhill and about 6,000*l.* for Balloch were the amounts awarded by the arbiters. This large sum, plus the cost of the new bridge at Balloch, has been almost entirely raised from bridge pontages and from taxation on proprietors, and a balance of 300*l.* is all that remains to be paid. The inhabitants of the Vale of Leven being aware of this, decided to raise by subscription that fractional amount rather than allow the pontage to enter on another year. The effort has been entirely successful.

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

THE TEAK TRADE OF SIAM.

A REPORT on the teak trade by Mr. Black, the acting Vice-Consul for Great Britain at Bangkok, has been issued by the Foreign Office. It contains information derived during a recent journey. Mr. Black says :—

The teak-bearing forests of Siam lie in the north, and the most productive region at present may be included in a circle which, drawn round Chiengmai and Phree, encompasses all the head waters of the Me Ping, Me Wang (Lakon River) and Me Yom. The right bank of the Me Ping from the Me Layan, down to Klong Kong below Kampeng, is also a very productive district. Both sides of the range of hills here are scattered over with teak forests, the timber on the west side being floated down the streams to the Thoungyengh and thence into the Salween, and that on the east side into the Me Ping and finally to Bangkok. The nearest teak forest to Bangkok is situated on the head waters of the Mewong (Sa Kay Krang River). The majority of the posts and small timber used in local consumption comes from the Nam Pat above Utaradit. A quantity of teak is derived from Nan, but no reliable statistics are as yet forthcoming in regard to this district.

The forests on the west, on the Thoungyengh, are said to have been worked for half a century, and those in Chiengmai and Lakon as early as the fifties at least.

The Borneo Company, Limited, had agents in the north in 1860, but it has only been within the last ten or twelve years that the production of teak timber has reached important dimensions, a period which was initiated by the treaty of Chiengmai and the establishment of a British Vice-Consul at that place. This step was brought about by the serious disputes which the growing timber trade occasioned between Burmese foresters and the local chiefs and owners of forests, and the difficulty of ascertaining in Rangoon or Bangkok the true aspect of such cases.

The lessees of by far the largest proportion of the forests in Siam are Burmans, a few forests are leased by Siamese and a small one by a Dutchman, but practically nearly the whole of the extensive teak forests of Siam are in the hands of British subjects, either by virtue of original leases or by an arrangement for working, which is almost equivalent to handing over a lease. A lease is obtained from the owner of the forest, and is executed in the manner prescribed in the treaty of Chiengmai.

The Burmese lessee is generally a man of very small means,

and when he has obtained a lease by ingratiating himself into the good graces of the owner and the local authorities—a delicate matter, requiring a great amount of tact and *savoir faire*—he applies to one of the trading companies in Bangkok for the capital necessary to carry out the working of the forest. This is supplied to him in large sums at a high rate of interest, and on an agreement by which all his timber is taken over on the banks of the streams, or otherwise, at a fixed price. About half the capital is forthwith expended in the purchase of elephants. The best elephants in the teak forests of Siam cost from 2,500 rs. to 3,000 rs.; ordinary elephants, 1,000 rs.; and as many as fifty or upwards are required in some forests.

The balance of the capital is necessary for advances to coolies and for working expenses for three or four years, as that time generally elapses before any timber actually reaches the market.

The first operation in the work of a teak forest is girdling the trees. This is done by making an incision 8 inches broad by 4 inches deep all round the trunk at a height of 4 feet from the ground, generally when the tree is in flower. The sap is most abundant at that time of the year, and the tree dies sooner. A tree to dry properly should be allowed to stand three years after girdling, but after some days the tree is again cut into the heart by a deep incision on each side, and in a period of six months to a year the tree is fairly dry and is cut down.

It is a day's work for one coolie to cut down a tree and finish it off by lopping away all the branches. Then the elephant comes into requisition. He drags the logs into various little heaps in the forest, and thence they are again hauled into the small streams. It is here that the purchaser, as a rule, puts on his hammer mark.

As the subject of hammer marks enters largely into the question of timber stealing, a brief explanatory paragraph may be inserted.

There are various hammer marks :—1. Forester's hammer mark. 2. Forester's selling hammer mark. 3. The purchaser's hammer mark.

Foresters also have a rough jungle mark, which is made by cutting a rude cross or angle with the axe on the log. The hammer marks of one owner are not confined to a single design, but vary according to the fancy of the owner or purchaser, for timber cut in different divisions of the forest, or timber bought in different districts. One man may have as many as a dozen different hammer marks, and sometimes many more, when all

the variations of lettering and design are taken into consideration.

The forester's mark is generally in the form of Burmese letters, and the purchaser's mark the initial letters of his name or company, such as B.C.L. (Borneo Company, Limited), B.B.C. (Bombay-Burmah Trading Corporation). The purchaser puts on his mark in the stream in the presence of the forester, and the whole upper side of the log is stamped with it to make defacing a work of difficulty. In addition to the royalty stamp, the log is thus marked over with the three different stamps above referred to, and the purchaser in addition stamps it with various private marks and numbers, when it is made up into a raft.

The logs lie in the streams till the rise of water in the beginning of the rainy season (May) floats them down to the Me Ping, Me Wang or Me Yom, as the case may be. There is generally not enough water in the small forest streams to float large teak logs continuously, and the elephant steps in again and performs the work, which has received the name of "hounding" from the Burmese. The timber gets stranded in the shallow places and sometimes it becomes piled up in immense heaps of two or three hundred logs. It is the elephant's business to disentangle this mass and float the logs off into deep water, a task which he performs with great skill. At the beginning of the season raftsmen are engaged, who go up the river to Ban Na, on the Me Ping, and to Whampia Cheng, on the Me Wong, and above Sawankaloke, on the Me Yom. They collect the timber as it comes down and form it into rough rafts, which are afterwards rearranged and measured at Raheng, on the Me Ping, and Sokotai, on the Me Yom.

Rafts are arranged in tiers or rows, and the logs are fastened together by stout rattan ropes fastened to holes cut in the ends of the logs. On the Me Ping the rafts contain, on an average, 150 logs, whereas the Sawankaloke rafts are smaller, averaging only 130 logs. The Me Ping rafts have generally ten logs in the first tier, which increases in the other tiers to sixteen, and then tapers off to ten again at the end. An outside row of logs serve as a fender, which can be cut adrift when the log collides with the bank or when there is danger of stranding at the side. This preserves the whole raft from being broken up. The Sawankaloke rafts are longer and narrower, beginning with a tier of six logs and increasing to ten. For a fender the outside rows slide endways into each other, and the whole raft is looser in arrangement than on the other river. The different character of the streams accounts

for the difference in arrangement of the rafts. The Me Ping is broad and shallow; the Me Yom is deep, narrow and tortuous.

The Sawankaloke rafts are fitted up with three large paddles as steering gear, but on the Me Ping the rafters have to remain in the water the whole day to steer the raft. Their gear consists of two stout rattan ropes, forty fathoms long perhaps, each fastened to a bamboo stake. To move the raft right or left one rafter sticks his bamboo stake into the soft sandy bottom and hangs on to it up to his neck in water till the proper adjustment of the course takes place. Steering gear by means of paddles is put on at Paknampoh. A raft takes ten or fifteen days to come down from Raheng to Paknampoh, and during that time the rafters are practically in the water the whole day. In another three or four days the raft reaches Cheinat, the duty station, where the up-country rafters stop and return. There are usually three rafters on a raft, and they get 7 salungs (2s.) a log from Raheng to Cheinat. From Cheinat to Bangkok, covered in from eight to ten days, rafting costs another 2 salungs a log. A raft comes down from Sawankaloke to Paknampoh in about ten days, and the rates for rafters are about the same as on the other river.

The rafting season begins in June with the rising water and timber floats down plentifully in July and August. For some time after that date the rush of water is too violent to float rafts in safety and sometimes the water is so high that the beds of the streams are unrecognisable.

There is danger then that a whole raft may float out into the rice fields, where it will remain stranded high and dry, an easy prey for timber thieves. In October, November and December, when the water is subsiding again, the greater portion of the timber is floated down.

Most of the timber stealing takes place in the Me Ping and the Me Yom above Paknampoh. When the rafters are collecting timber at Ban Na, above Raheng, a sudden rise of water may take place in one night. It is impossible to secure all the wood, and off it goes with the rushing flood and gets past Raheng, where coolies are on the look out, in the night perhaps, or by day if the water is very rapid. Hundreds of logs thus get stranded below Raheng, and the number is added to by rafts that are broken up by collision with banks or that are maliciously cut adrift, or are stranded accidentally. The timber thief is on the alert at this season. He picks up the logs, disposes of them by sale to the local sawyard, or, as is most generally the case, hauls them up to his own back yard, where, with

the assistance of a friendly neighbour, they are cut into posts and planks, and are supporting the roof of a new house, or form the flooring of a new verandah, by the time the agents of the owner are searching the river for the lost timber. Or the logs are dragged into the jungle, where the property marks are burnt out or otherwise obliterated, and after a year or two they are floated down in the chance of not being recognised. Probably the majority of the logs are quietly sawn up by the thief himself.

In the absence of direct official supervision a great deal of theft takes place in a much more open way. A party of rafters go up the river, either of their own accord or instigated by native traders. They collect all the lost timber they can lay their hands on, and bring it down to Paknampoh or Cheinat. There it is purchased at a low rate by unscrupulous native traders, who know well that the timber is stolen. There are no regulations at present by which any official may detain suspicious timber on his own initiative, but the agents of the Borneo Company, Limited, and Bombay-Burmah Trading Corporation examine rafts at Paknampoh, and if they find any of their own timber in the rafts they cause it to be detained by the authorities and prosecute the rafters, or the owner if the rafters divulge his name. The defence of the accused is usually that they picked up the timber for salvage.

Foresters who have no agents at Paknampoh have little chance of recovering stolen timber. The British companies look after their own timber themselves as much as possible with the aid of efficient staffs, who search the river twice a year with elephants for the stranded timber. Even with these precautions the amount of their losses by theft is put down at from 3 to 5 per cent. The quantity of timber belonging to native buyers and small British foresters must considerably exceed this figure. A considerable amount of timber is also sold without authority by the rascally agents of foresters who are employed to pick up the timber which has been sent down. These agents are all Burmese, but the foresters have themselves to blame, of course, for their losses in this way.

Timber, to a small extent, is stolen in the streams by the servants of the foresters, or by others, and also below Paknampoh and Cheinat when a raft gets broken up. The logs are carried off, and are taken down one of the numerous creeks and branches into which the Menam splits up below Cheinat. A raft, however, does not often break up below Paknampoh. Rafters pick up any timber they find on the way down, sometimes *bona fide* for salvage, for which a sum of 1 tical per log has been fixed by custom, but more generally to dispose of it to

their own advantage. Timber stolen on the Me Yom is nearly all passed into the Menam by the Pak Pring Creek (navigable only in the wet season), and is used locally or cut up in one of the numerous sawyards.

To prevent this large loss by theft it is absolutely necessary that regulations for the control of teak timber in transit should be issued, and that they should be carried out by a separate staff of officials. The draft regulations appended to this report have been drawn up on the basis of the regulations of Upper Burmah, but have been considerably simplified to suit the altered conditions of government in Siam and the different customs of the trade. Every separate clause has been discussed with the managers of the British companies in Bangkok, and with a representative of Burmese traders, and their suggestions and alterations where practicable have been incorporated. These draft regulations, therefore, represent in a complete form the views of the British merchants as to the nature of the legislation required and the extent to which they are willing to confirm restrictions in the trade.

It has already been pointed out that the working of teak forests is to a very large extent in the hands of British subjects, but this is not the case with the purchase of the timber. From statistics which have been obtained from private sources it appears that British buyers represent about 42 per cent. of the business, natives (mostly Chinese under Siamese jurisdiction) 48 per cent, and a Chinaman under French protection 10 per cent. The British purchasing trade is almost entirely in the hands of the Borneo Company, Limited, and the Bombay-Burmah Trading Corporation, of which two firms the Borneo Company, Limited, is the longest established and has the largest interest.

To estimate the amount of capital which lies locked up in the teak forests is a matter of some difficulty, as it is of course impossible to ascertain the capital of each individual firm. But, roughly speaking, it can be calculated from the production. The average production of full-sized marketable logs, *i.e.* logs over 5 kam (21½ inches) in semi-girth, may be put down at, say, 60,000, and valued at 35 ticals a log, which makes a total of 2,100,000 ticals. A period of four years on an average elapses in the teak trade before any turnover is made—that is, capital invested now will not be realised till four years hence, when the timber is actually in the market. Therefore, multiplying 2,100,000 ticals by four, we arrive at 8,400,000 ticals (530,000 £), which is necessary to work out the logs which are brought down to the Bangkok market.

Taking the average of the timber that floats into the Salween from Siamese forests at 40,000 logs, which is, if anything, below the mark, we arrive at another sum of 5,600,000 ticals (350,000*l.*). This sum, with the Bangkok capital, represents about 880,000*l.* invested in the teak forests of Siam. By far the largest proportion of this capital is British. The native-bought timber is estimated at 48 per cent., but the majority of these buyers do not advance money to foresters as British merchants do. They simply purchase the timber from year to year. The capital, therefore, is mostly in the hands of Burmese foresters, by whom the forests are principally worked.

The revenue which is derived by the Siamese Government from the teak business is a fairly considerable one. The duty is based on what is called the "pikat" rate, a standard of value by measurement, and averages 10 per cent. of the actual selling value of the timber. Timber is sold in Bangkok at so many times the "pikat" rate. Thus a log of 6 wah (39 feet) long and 9 kam (38½ inches) in semi-girth is valued at 10 ticals at the "pikat" rate. The market rate at present is 5 pikat, therefore this particular log will be sold at 50 ticals. The statistics here given regarding logs refer only to full-sized timber, viz. 5 kam (21½ inches) in semi-girth, as this is the only class of timber which is exported or which traders of any importance deal with.

In addition to this timber, a very large quantity of posts and saplings find their way to Bangkok, or are used on the way down the river. The largest proportion of these posts come from above the Pichai and Utaradit, where the business is in native hands.

The loss to the revenue and to the country in general is enormous by this indiscriminate destruction of valuable young trees. If the local authorities would enforce the conditions of the leases prohibiting the felling of trees under 5 kam (21½ inches) in semi-girth the practice would be checked in the Chiangmai, Lakon and Phree districts, but special regulations would appear to be necessary in the districts above Pichai and Utaradit, where such leases are not in vogue, and where natives work on simple permits received from the local chiefs.

The total number of logs which passed the duty station at Cheinat in 1893-94 was 109,957; of these 72,930 were full-sized logs, which leaves the number of undersized logs at 37,027.

The best class of this small timber, say a log less than 5 kam (21½ inches) in semi-girth and 4 wah (26 feet) long, is worth 5 ticals. In thirty years' time this log would

have increased to 9 kam in semi-girth (38½ inches) and 6 wah long (39 feet), and would have sold at 50 ticals, *i.e.* by cutting it now a loss of 45 ticals has been incurred. The total loss on 37,000 logs, therefore, is 1,665,000 ticals (100,000*l.*). The number of undersized logs floated down the Salween is larger in proportion than to Bangkok, and may be estimated at, say, 20,000. Making the same calculation as to loss incurred we arrive at another sum of 900,000 ticals (56,250*l.*), which, added to 100,000*l.*, makes up a total loss of 156,250*l.* Siam, therefore, loses every year by the reckless destruction of young timber a sum which may amount in some years to as much as 156,250*l.*, and the actual loss to the revenue at 10 per cent. is over 15,600*l.*

PATENTS.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

TRADE NOTES.

THE new schools, Mansfield Woodhouse, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Expanded Metal Company have removed their London offices to 39 Upper Thames Street, E.C.

THREE windows, respectively memorials to the late Mrs. C. H. Barnsley, have been inserted in the Sandon Road Wesleyan Church, Birmingham. The subjects depicted are:—(1) "Dorcas distributing Bread and Garments to the Poor" (inserted in the canopy is an angel holding a crown); (2) "Mary, illustrating Worship, and Martha, Service, with the Lord as Teacher;" (3) Our Lord with Children, and presentations to Him." The whole of the windows also contain portraits of the deceased lady, and in one window also of the children. The work was designed and executed by Messrs. Swaine, Bourne & Son, Birmingham and London, who also executed the large window in the church.

ON Thursday, May 30, a reredos in Caen stone was dedicated in St. Nicholas' Church, Rattlesden, Suffolk, in memory of the late Lieutenant-Colonel Windsor Parkes and his wife, by their surviving children. Colonel Parkes represented the Western Division of Suffolk for twenty-six years in the House of Commons, finally retiring from Parliament in 1880. He was a staunch supporter of the Conservative Government of the day, and was much esteemed by the late Lord Beaconsfield. The reredos that has just been erected to his memory has been executed entirely by Messrs. Jones & Willis, of 43 Great Russell Street, London, and is a beautiful work of art; the centre panel, which is a reproduction in Caen stone of Leonardo da Vinci's picture of the *Last Supper*, is excellently carved, the sculptor having cleverly and faithfully reproduced the expression on the faces and the pose of the figures.

THE *Leeds Mercury* says:—The joiners' strike in Leeds is now at an end. The 350 men who have been standing out for an advance of wages and other advantages were to return to work yesterday, Thursday. The men originally asked for an advance of wages from 8d. to 9d. an hour. The masters expressed their willingness to give them 8½d., but this concession the men refused to accept. They reduced their claim, however, to 8¼d. In regard to the reduction of working hours in winter which the men desired, concessions have been made on both sides.

THE committee of the Aberdeen Town Council have accepted tenders for the construction of a new bathing station at the beach. The contracts amounted to 2,689l.

AT the meeting of the Penrith Rural District Council it was stated that Mr. Brebner, contractor of Edinburgh, wished to decline the contract for the waterworks at Ousby. His tender amounted to 827l. The next lowest, that of Mr. Joseph Jackson, of Penrith, amounted to 927l. It was agreed that the contract should be offered to Mr. Jackson, but that if he declined or wished for an alteration in the terms, the contract should be reopened to competition.

AT the meeting of the Gloucester City Council tenders were received for carrying out the contracts in connection with the Newent extension of the waterworks. The principal one was for cast-iron pipes. That sent in by Messrs. Cochrane & Co. was accepted at 10,373l. It was agreed to apply to the Local Government Board for sanction to borrow a sum of 5,000l. for erecting a sanitary dépôt and stabling, and a sum of 3,000l. for works of street improvement, sewerage and water-supply.

AT the meeting of the Liverpool City Council on Wednesday the resolution of the Council of April 3, 1895, accepting the tender of Messrs. J. Paterson & Son, 60 Soho Street, Liverpool, for the erection and completion of the proposed new Central Fire Station and Police Buildings in Hatton Garden for the sum of 30,770l. was rescinded.

AN outbreak of fire took place at the historic Dee Mills at Chester on Thursday morning, the 30th ult. On the previous day an experimental trial had been made of the performance of a new Merryweather engine just lately received. Messrs. Merryweather's engineer, Mr. Harper, had not left the city; he was roused out of bed, and as soon as he with the new machine appeared on the scene to aid the six jets already playing on the burning pile, the fire brigade speedily got the fire under. The legend or prophecy ran that thrice the Dee

Mills would be burnt, but the originators of the legend did not allude to this, the fourth fire. Luckily the pile was preserved from total destruction.

WE hear that Mr. C. H. Mabey has just executed and fixed a granite fountain in the Paddington Recreation Grounds, and it was understood that it was the intention of the donor, Mr. R. M. Beachcroft, to open the fountain yesterday (Thursday). The fountain bears the following inscription:—"This fountain was erected in 1895 by R. M. Beachcroft, Alderman, L.C.C., to commemorate the acquisition of the first public recreation-ground in London established on self-supporting principles." Mr. Mabey has also executed the models and carving in stone and wood, and also the ornamental fibrous plaster ceilings, for the new Clerkenwell Town Hall, which is to be opened on the 14th inst.

VARIETIES.

A SITE has been selected by the Carlisle Town Council for a fire-engine station. The special committee have decided to employ an independent architect to prepare plans, &c.

PROGRESS is reported by the engineers of the Upper Stour Main Valley Sewage Board, Messrs. E. B. Martin and W. G. Fiddian, on the whole of the contracts. It has been decided to apply for 10,000*l.* from the Public Works Loan Commissioners, this making the second instalment of the 87,433*l.* required to carry out the sewerage scheme.

THE Eccles Town Council will apply for a loan to carry out extensions to the town hall for municipal offices. The plans have been prepared by Mr. A. C. Turley, the borough surveyor.

THE Local Government Board have now given their sanction to an application made by the Macclesfield Corporation to borrow 60,000*l.* for works of sewerage and sewage disposal. The scheme includes an outfall sewer to convey the sewage to a site three miles below the town, and precipitation works and an irrigation area of 59 acres. The object of the scheme is to purify the river Bollin, which is now polluted by manufacturers' refuse. The engineer to the scheme is Mr. W. H. Radford, of Nottingham.

THE Grand Ducal Court Company of Saxe-Coburg and Gotha, comprising 133 persons, have made arrangements with Sir Augustus Harris to give for the first time a course of performances at Drury Lane Theatre. They arrive in London

via the Hook of Holland on June 14, and open on June 17 with Zeller's comic opera "Der Vogelhändler," which will be followed by the comedy "Die Ehre" and other equally interesting plays.

PLANS have been prepared by Mr. H. Quick, architect and surveyor, for the erection of the new mission-room and classrooms of St. Thomas's parish, Coventry. The contract has been given to Messrs. Bolton & Paul, of Norwich.

THE Local Government Board have sanctioned a loan of 12,500*l.* to the Rushden Urban District Council for the construction of sewage disposal works.

ANOTHER of the diamond-borings for water advised by Professor Nordenskiöld has been successful on the coasts of Sweden, it is stated, this one being on the little island of Marstrand, on the west coast of Gothenburg. The boring was undertaken in a rock standing 8 metres above the sea, and was carried to a depth of 39 metres.

PLANS are being prepared by Messrs. G. & J. Steané, of Coventry, for still further enlarging the extensive buildings of the local provident dispensary.

SIR ROBERT PULLAR, of Perth, is to be presented with a portrait of himself, to commemorate his receiving knighthood.

THE Leeds City Council have appointed Mr. George Fearnley Carter assistant in the Insanitary Areas Engineering Department, at a salary of 200*l.* per annum.

THE Shore Old Mill at Oldham has collapsed from roof to basement. Several passers by had narrow escapes. It is ten years since cotton spinning was carried on in the premises, which have latterly been let in tenements to various tradesmen. The building was six storeys high, and it is supposed the collapse is due to decayed beams. The borough surveyor was at once communicated with, and steps taken for the public safety.

A REPORT has been furnished to the heritors by Mr. James Barbour, architect, Dumfries, on the insanitary condition of Lockerbie parish church. The report embodies two plans for the improvement of the building, to cost 140*l.* and 600*l.* respectively. The latter includes a slight extension of the building and an improvement of the ventilation, and was recommended by Mr. Barbour as essential in order to put the church into a satisfactory condition. The heritors offer a sum of 1,000*l.* for a larger scheme of restoration to the kirk session if desired.

BUILDING AND BUILDERS.

AT Ayr Messrs. Bennett & Sons have purchased an old block of buildings fronting Wellington Square and Fullarton Street. The purchasers intend to erect on it business buildings, four storeys high, at a cost of 15,000/. Miss Jane Houldsworth, Roselle, has also had plans prepared of a block of buildings in Newton, specially for working people, which are to cost several thousands.

THE 13th inst. has been fixed by Sheriff Cowan for hearing the petition of the Paisley Police Commissioners in regard of an alteration of the building by-laws, so that it shall be allowable for mutual gables to be 9 inches from the chimney or flue and 4½ inches on each side, instead of 9 inches on each side of the flue as at present, thereby reducing the gables from 2 feet 3 inches to 18 inches. In the case of outside gables, it is asked that there be 6 inches of stone on the outside, 9 inches from the chimney or flue, and 9 inches of brick or stone on the inside, thereby reducing the gable from 2 feet 3 inches to 2 feet.

THE Kirkintilloch Dean of Guild Court have passed plans for rebuilding the premises at the Old Foundry, occupied by Messrs. McNeill & Co., as a felt manufactory, which were recently burned down.

AT Edinburgh the Lord Provost's committee of the Town Council have recommended that plans should be prepared by the City Superintendent of Works for the reconstruction of North Bridge Street, so that the erection of the two tenements at the north end may be proceeded with in conformity with a general design.

AT the holding of the Edinburgh Dean of Guild Court twelve warrants were granted, and included was one for building a church for the trustees of the Kirk Memorial E. U. Church.

THE death is announced of Mr. J. H. Routledge, builder, of Mealsgate, Carlisle, after suffering a few days from severe cold. Mr. Routledge was, the *Carlisle Journal* says, one of the best known men in the district. The Uldale Grammar School, recently opened, was built by him.

AT Leeds a new building is about to be erected in Park Row, for the National Provincial Bank of England, from the designs of Messrs. Perkin & Bulmer, architects.

THE Glasgow Police Commissioners have approved of erection at Govanhill of accommodation for the police, fire, and lighting departments at an estimated cost of 18,000/. At the meeting it was stated that the contractors have three years to build the new Glasgow bridge, though it is expected it will be finished before that time.

THE Glossop Town Council have decided to apply for borrowing powers for 44,000/. instead of 40,000/. to carry out the proposed sewage scheme.

THE Leeds City Council have authorised the erection of a caretaker's house at Wortley Recreation Ground at a cost not exceeding 300/.

ELECTRICAL.

THE North Staffordshire Tramway's Company have intimated to the local authorities in the potteries proposals to carry out a great expansion of their system, and to use electric force for the propulsion of the tramway cars.

THE factory of Messrs. J. & J. Cash, Kingfields, Coventry, is to be enlarged by the addition of a warehouse and shed. Electrical power will be introduced to drive the machinery. Mr. C. G. Hill's tender of 5,300/. for the building has been accepted.

THE new lighthouse at Penmarch Point, Brittany, the thirteenth of those lighted by electricity on the French coasts, will be, it is stated, about 130 yards to the eastward of the present one. Its tower, which will be about 185 feet above high-water line, is being built entirely of the best description of granite, and the light will be of such intensity as will, it is said, enable it to be seen at a distance of nearly 100 miles in clear, and from 25 to 28 miles in hazy weather, having an illuminating power of 10,000,000 candles. It is hoped that the new light will come into operation at the commencement of 1897.

OETZMANN & CO.,

HANDSOME INLAID ROSEWOOD OVERMANTEL,
With 7 bevelled plates, &c., 4 ft. wide by 4 ft. high, 48/6.

THE "E. R. A." PHOTO BLOCK COMPANY,

City Office:—4 & 5 East Harding Street, Fetter Lane, E.C.

Half-Tone Blocks prepared from Water Colour or Pencil Drawings or Photographs, to print with type, on an entirely new Method, by which the Cross-bar grain is dispensed with, giving greater brilliancy to the picture, and more definition of detail.

For Particulars and Specimens apply to ALFRED FISH, Manager.

THE SANITATION OF WORTHING.

A PAPER on the "Sanitary History of Worthing" was read at the Conference of Sanitary Inspectors on the 1st inst. by Mr. C. T. Gardner (chief sanitary inspector). Describing the condition of the place in 1845, when the population was about 4,000, the area 584 acres, and the number of houses 1,200, he alluded to a unique arrangement of drainage then in use on the first floors of houses in Warwick Buildings, now Warwick Road, in the shape of wooden hoppers, emptying into a wooden trunk which discharged on the foreshore. Yet, although in other respects also the sanitary arrangements were most primitive, Worthing neither in 1847 nor 1849 yielded a victim to cholera. In 1853, however, a local board was established, and in 1857, under the superintendence first of Mr. Ranger, and afterwards of Sir Robert Rawlinson, extensive systems for drainage and water supply were carried out at a cost of over 30,000*l*. The sewage was then conveyed to the Teville stream, discharging at the eastern extremity of the foreshore into the sea, but for some years afterwards a great portion of it was pumped upon land belonging to a local company, the Worthing Land Improvement Company. Owing to the rapid growth of the town, however, in 1876 the outfall was found to be inadequate, and the Local Board decided to construct a new outfall sewer which should discharge its contents into the sea at low water. In the same year new machinery was added at the waterworks, costing, with the outfall, a further 14,000*l*. In 1881 improved regulations were made with regard to the water supply, and in 1884 further extension took place. In 1890 the charter of incorporation was obtained, and in the following year the census returns showed a population of 16,666, an area of 1,425 acres, and houses numbering 3,189. In May 1893, an unfortunate outbreak of disease occurred, and the Council decided to remodel and reconstruct the whole of the system of drainage and water supply. The sewage works were estimated to cost 40,000*l*, and the waterworks 35,000*l*, the Council having also decided to acquire the West Worthing waterworks at a cost of 26,500*l*. In 1893 also the sanitary committee gave instructions for a house-to-house inspection of the borough, which had been proceeded with as speedily as circumstances would admit, the result being that upwards of 30,000*l* had been expended by the various owners and occupiers within the borough to conform with the wishes of the committee. It was apparent that the town was fast approaching its former prosperity. This was mainly due to the well-directed efforts of those who had worked together—the Council, the officials and

the burgesses—for the common good, and with all natural advantages, unrivalled climate, fine sands, lovely walks and drives, and pure air, Worthing was, and must remain, one of the healthiest watering-places on the English coast.

THE INSTITUTION OF CIVIL ENGINEERS.

FOR some of the original communications read and discussed at ordinary meetings of this Institution during the past session the Council have made the following awards, viz.:—George Stephenson medals and Telford premiums to A. J. Durston, Engineer-in-Chief, R.N., for his paper on "The Machinery of Warships," and to J. I. Thornycroft and S. W. Barnaby for their joint paper on "Torpedo-boat Destroyers"; Telford medals and premiums to W. D. Bruce for his description of the "Kidderpur Docks, Calcutta," and to S. J. Berg for "The St. Gothard Mountain Railway and the Stanzerhorn Cable Railway"; the Manby premium to C. Butters and E. Smart for their joint paper, "Plant for the Extraction of Gold by the Cyanide Process"; and a Crampton prize to J. Richardson for "The Mechanical and Electrical Regulation of Steam Engines." For papers printed in the proceedings without being discussed—a Telford medal and a Telford premium to A. Sharp for "Circular Wheel-teeth"; a Telford medal to the representatives of the late Henry Gill for his paper on "The Filtration of Muggel Lake Water Supply"; Watt medals and Crampton prizes to J. A. Griffiths for "Windmills for Raising Water," and to A. J. Hill, for "Repairs and Renewals of Railway Rolling Stock"; and Telford premiums to O. Guttman for his account of "The Removal of the 'Iron Gates' of the River Danube"; to K. Leibbrand for his paper on "A Concrete Bridge at Munderkingen"; to A. Scott for "Deep-water Quays at Newcastle-on-Tyne"; and to D. Cunningham for "The Estuary of the Tay." For papers read at supplemental meetings of students Miller prizes were awarded to W. G. Wales for "Caissons and Gates for Closing Lock and Dock Entrances"; to S. H. Barraclough for his paper, contributed jointly with L. S. Marks, entitled "Some Experiments on the Heat-Losses to the Cylinder Walls of a Steam Engine"; and to E. E. Matheson for "Timbering in the Amptill Second Tunnel"; whilst for papers read before local associations of students Miller prizes were bestowed on A. M. Stewart (of Glasgow) for "The Glasgow District Subway"; on R. C. Farrell (of Glasgow) for "The Permanent Way and Signalling of the Glasgow Central Railway"; and on H. Fowler (of Manchester) for "The Testing and Inspection of Plates."

MAURICES MAURICE'S PORCELEINE,

For Painting and Preserving Wood, Stone, Metal, Plaster, or any Surface on which Paint can be applied.

BRIGHTER THAN ENAMEL. EASY TO APPLY. NO BRUSH MARKS.

Cheaper than Paint and Varnish where a glazed finish is required. A Saving in Labour, only two or three coats being required on new work.

SAMPLES FREE TO ARCHITECTS AND BUILDERS.

FOR WALLS AND WOODWORK.—Maurice's Porcelaine is the best article in the market when a bright and durable finish is required; it is easy to work and gives a lasting glaze equal to China.

CEILINGS.—Our White is incomparable, and will keep its colour for years; it has binding qualities that prevent Ceilings from Cracking.

ENGINEERING.—For Iron or Metal-work of all descriptions it is a protective against Corrosion, and gives a beautiful finish, and on account of its heat-resisting qualities is in every way suitable for Stoves, Engines, Electrical Apparatus, &c.

All the above remarks are Guaranteed, being the results of Practical Tests.

SANITARY.—It is suitable for Sanitary Work, being in itself a Sanitary Invention, giving an Impermeable Ceramic Surface which will resist even HOT WATER. For Corridors, Baths, W.C.s, Lavatories, &c., it is invaluable, being Washable and Damp-proof.

APPLICATION.—It is supplied by us ready for use in drums or barrels, and is applied the same as ordinary paint, without priming of any kind.

COLOURS.—We stock 200 Tints, or can supply any other Colour or Tint within Two Hours' Notice, or the Ivory and White can be tinted with ordinary Oil Tinters to any desired shade.

FLATTING.—PORCELEINE is supplied to dry Flat when required.

MAURICE'S LIQUID GOLD.—This is valuable for Interior Gilding, being an Improvement on Ordinary Gold Metallic Bronze Paints. Price, ready for use, 5s. per lb.

Write for Special Quotation for Quantities to

THE PORCELEINE CO., LANFRANC ST., LAMBETH, LONDON. S.E.

THE SANTOS DOCKS.

WHAT are termed the Santos Docks, the *Dundee Advertiser* says, are a solid construction of quay wall, with a frontage of 800 mètres, which carries a double line of rails in connection with the São Paulo Railway Company's traffic, extensive iron warehouses for goods, built at intervals along the extension, and hydraulic cranes (Armstrong system) movable on rails and capable of lifting one and a half tons each from the vessels discharging, is what is termed the Santos Docks. The first section, which extends from the Custom House to the old railway pier, is now open to traffic, and the construction of the section from the Custom House to Paqueta is being pushed forward energetically. An important item in the work is the dredging of the quay berths, and it has been calculated that to obtain a regular depth of 25 feet 12,007,000 cubic mètres of mud have to be dredged; to obtain 25 feet 3 inches, 18,063,700 cubic mètres; and to obtain 29 feet 6 inches, 24,146,000 cubic mètres. In order to arrive at this conclusion 1,000,000 to 1,500,000 cubic mètres must be dredged annually for this important work, and a new steam dredger will shortly arrive capable of dredging 200 cubic mètres per hour, at a depth of 12 mètres, and fitted with electric light for night work. The total extension of the quays when completed will amount to 4427.33 mètres, and then, after the old vessels that are abandoned and sunk in the river are removed, Santos will become the most important seaport in South America, and the commercial emporium not only of the state of São Paulo and of the vast territories of Minasserales, Goyaz and Parana (which are already connected), but also the states of Santa Catharina, Rio Grandedotul and Matto Grosso, which will also be connected in a few years by the railways now in course of construction. The inauguration of the half of the first section was effected on February 1, 1892, and thrown open to traffic.

BRIGHTON TOWN HALL.

PLANS have been prepared by the borough engineer and surveyor providing needed additional accommodation in the Town Hall, without encroaching on the market. The cost will be about 30,000*l.* The additional accommodation provided by the scheme now proposed will be sufficient for the requirements

of the Corporation for many years to come. The committee recommend that the plans be approved, and that they be authorised to advertise for tenders for carrying them out, and that the money be borrowed under the Brighton Improvement Act, 1884, for a period of thirty years. The main proposals are as follows:—

1. To reduce the incline of the road on the east side of the Town Hall, which now has a steep fall towards the east, to nearly a dead level, thus allowing the present basement of the building on that side to be treated practically as a ground floor suitable for offices. 2. To add a new wing to the Town Hall on the east side, extending over the ground now covered by the great flight of steps, thus giving an additional floor area of about 6,500 square feet. 3. To extend the recessed external walls of the Town Hall above the first floor on the east, west and north sides of the building to the line of the external walls of the ground floor, thus providing an additional floor area of about 3,000 square feet. 4. To gut the whole of the interior of the building and to rearrange it, with the additions, so as to provide the best accommodation possible for each department.

The main architectural style and features of the existing building will be retained in all the alteration, and will be reproduced in all the additions. Stock brickwork faced with cement will be used for all the external walls except where it may be necessary to substitute Portland stone as used in the existing building. The principal alterations in the appearance of the elevations will be those to the windows, which will be enlarged to provide both better light and air. The existing entrances on the north and west sides will be retained as the principal entrances for the public. The north entrance will give access to the upper floors by means of the central staircase, while the west entrance will open into the central hall, from whence access to the upper floors will be provided by means of a hydraulic passenger lift. The present entrance to the Police Offices will be abandoned. There will be no public entrances to the Town Hall on the east side of the building, but the entrance to the Police Department will be on the south side of the new annexe, and the entrance to the sanitary offices on the north side of the new annexe. There will be no entrances on the south side of the Town Hall.

The new police court and offices will be formed in the new annexe on the east side of the Town Hall; the space now occupied by the police and magisterial department will in future be allocated to the use of the municipal offices; the vacant space under the floors of the assembly room and council

chamber will be utilised; the eastern side of what is now a useless basement will be adapted for use as offices; the existing prison cells will be retained.

DWELLINGS OF THE POOR IN PROVINCIAL TOWNS.

AT the annual conference of the Sanitary Inspectors' Association at Worthing on the 1st inst., a paper by Alderman Cortis, chairman of the local sanitary committee, on "The Dwellings of the Poor," was read. The author said that his object in writing the paper was not to raise the class known as the dregs of society, but rather to exterminate them, for, as a "class," he urged that the dregs of society ought not to exist. Neither did he suggest the invocation of Parliament to improve the law except to a very slight extent; his appeal was to those who had the administration of it. Before they asked for further legislation they must fearlessly and honestly administer the laws they already possessed. The first evil caused by neglect in this matter was the increased mortality of the nation, but this was not the greatest evil. In fact, were the increase confined to the districts causing it he should hesitate to call it an evil at all from a worldly point of view. Not that he underestimated the value of a human life, but from the point of view of political economy the loss of the lives of the *habitués* of the slums was a positive gain to the commonwealth, because—and this was the second evil—while they lived they waged a perpetual war against society, which to defend itself was driven to make laws curtailing the liberties of law-abiding citizens. They entailed also an immense loss on the nation by forcing them to increase the police, magistrates, judges and juries, and eventually they had to be housed in their reformatories, gaols and workhouses. Thirdly, they were schools of vice, entailing moral degradation on the pupils, to be disseminated through the length and breadth of the land, and another evil to which they were subjected through the existence of these congested districts was the importation of the pauper alien. This state of things continued because capital invested in the rotten homes of the poor yielded the highest interest; they were the dearest homes in the land, and simply because sanitary authorities closed their eyes and ears, while the owners took their 10 to 20 per cent. profit. Hence people with limited capital were tempted to invest in slums, screwing out of them the greatest profit they could, and keeping them at the lowest level of dilapidation. Sometimes it happened that when an attempt was made to improve them the

owners were found to be almost as poor as the occupiers. The authorities, under the circumstances, hesitated to enforce the law, which, if carried out, would involve the ruin of the owner, and in that way the evil was perpetuated. The proper plan was to insist on good sanitary conditions, so that the small capitalist would cease to find these poor properties the most profitable investments. The question next arose, "What is to be done with the ejected of the slums when their homes are demolished?" In Worthing, by acting tentatively and in seasonable times, they had managed so far without any such provision.

Since the passing of the "Housing of the Working Classes Act, 1890," out of forty-eight houses reported unfit for human habitation, twenty had been put in order and made habitable, twenty-eight closed and fourteen eventually demolished. Still, in his opinion, some provision should be made for the ejected. His suggestion was that in every town municipal cottages should be erected and tenanted from time to time by ejected families. In moderate-sized towns these cottages should be within the town area, so that tenants might be within easy distance of their work, but in large cities with congested areas, such as London and Liverpool, where overcrowding both of houses and inmates existed, they should be erected outside the city, and the tenants conveyed to and from their work by tram or train at a nominal charge, say one penny per journey, jointly at the imperial and local expense. This was the only legislation he asked for. With this exception the Housing of the Working Classes Act of 1890 was comprehensive enough for what they wanted, the great need being, as he said before, administration—thorough, systematic sanitary inspection, in fearless and honest administration of the law. The author concluded his paper by reminding the members of the Association that the health of the community was in a great measure in their hands, and that many of the comforts of life depended on the efficient and honourable discharge of their duties. He even believed in their power by fulfilling them to save more lives and to do more materially for humanity than all the doctors and physicians that were their contemporaries in the district in which they lived and worked, or prevention was not, as they were taught, better than cure. His desire had been to call attention to an evil that affected all classes of society, to awaken the public to a sense of their responsibility with regard to the conditions of life of their poorest brethren, and to impress upon them the national importance of dealing promptly and effectively with this great question—the amelioration of the home life of the poor.

WIND PRESSURE ON BRIDGES.

AMONG rules issued by the Public Works Department, India, the following one has been issued as to wind pressure on girder bridges:—

The amount of wind pressure on a railway bridge is to be calculated on the assumption that the maximum normal pressure may be $1\frac{1}{2}$ tons per 100 square feet of surface exposed. The surface exposed to be reckoned as follows:—

A train surface calculated on a height of 13 feet 6 inches on the 5-feet 6-inch gauge, or 11 feet on the metre gauge, multiplied by the total length of the girder.

The actual surface of that portion of one girder which may be below rail level, or at a height above rail level of more than 13 feet 6 inches on the 5-feet 6-inch gauge, or 11 feet on the metre gauge. Also, in the case of triangulated girders, the actual vertical surface of that portion of the leeward girder which may be below rail level, or at a height above rail level of more than 13 feet 6 inches on the 5-feet 6-inch gauge, or 11 feet on the metre gauge.

The total wind pressure thus calculated is to be provided for by a proper system of wind bracing, or floorplating, and its effect taken into account as forming a part of stress on the chords of the main girders. Proper arrangements must also be made at the girder ends to secure sufficient stiffness to resist racking action where diagonal stiffeners are not used.

Wind pressure is to be treated as "fixed load," and its effect on the different members of the structure is to be allowed for as provided in the rule for "maximum permissible stress."

BISHOPSGATE IMPROVEMENTS.

A MEMORIAL to the City Commissioners of Sewers has been prepared with reference to the proposed improvement in Bishopsgate Street Within, near the church of St. Helen. The memorialists state that, being ratepayers, owners and occupiers of houses and offices in the parish of St. Helen, they invite the attention of the court to the urgent necessity of improving and widening the entrance to Great St. Helen's from the main thoroughfare of Bishopsgate Street Within. "The present entrance," they say, "is formed by a very narrow roadway without footpath of any kind, and under a low arch between Nos. 35 and 36 Bishopsgate Street. The narrowness of the

roadway and the absence of any foot pavement have for a long time caused the greatest inconvenience, as well as considerable risk of injury, to foot passengers, as there is a large traffic of wine merchants' vans and carts constantly passing in and out of Great St. Helen's. It is a matter of daily occurrence to see the entrance blocked by a waggon or van endeavouring to make its way into or out of this narrow road, and foot passengers are in consequence positively shut out of Great St. Helen's for the time being, and have to make their way round through the entrance into Crosby Square, which is almost equally inconvenient and dangerous. The present old wooden building, No. 36 Bishopsgate Street, is about to be pulled down and a modern building erected on its site. We would, therefore, submit that this is an opportune time for effecting a much-needed improvement, which would not only remove a source of difficulty and danger to foot and carriage passengers, but would also afford an adequate approach to the beautiful and historic church of St. Helen, which has recently been admirably restored and is justly considered as one of the finest and most interesting churches in the City."

THE GROWTH OF WOLVERHAMPTON.

WOLVERHAMPTON has been so long associated with the appellation of "the Metropolis of the Black Country," that in the minds of many people, says the *Birmingham Post*, the idea may have occurred that, owing to the severe depression for years past in the iron and hardware trades which has visited this part of the United Kingdom, the borough may have received a severe check to its material progress. Such, however, has not been the case, and although the population has not increased at so rapid a rate as in the neighbouring town of Walsall, there has been a very marked advance, and a native of the town, after an absence of a dozen years or so, would be surprised at the beneficial changes which have taken place in the centre of the town, and more especially at the numerous groups of dwellings of all kinds which have appeared on the outskirts of the municipal district, where of late years land has been cut up for building sites and streets of houses have sprung up in so surprisingly expeditious a manner as to leave little doubt that there is sufficient vitality in the commerce of the immediate neighbourhood to provide additional work year by year for a steadily-growing population.

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo, BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.
 "They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.
 "The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

It is also a gratifying feature as indicating the faith that exists in the stability of the staple industrial concerns of the town that in almost every case where extensive building operations have been embarked upon they have been undertaken, not by outside people, but by well-known local business men, who, after a lengthened experience, have been able to weigh up the probabilities of wisely investing their money in house property, and they appear by the continued rearing up of small houses to be thoroughly satisfied that Wolverhampton, instead of being a decaying town, has a far more gratifying commercial career before it than some people are willing to give it credit for. In one or two cases the estates of well-known old Wolverhampton families have been bought up for building purposes, and in one instance the picturesque domain where a present-day budding statesman was wont to romp in childhood's hours has now passed into the hands of the speculative land agent and builder. Notably have great alterations taken place in the district which it is hoped will shortly be formed into the new ecclesiastical parish of St. Chad, where, starting from Hillside, Lea Road has been made a trunk thoroughfare from which a number of streets, sufficient in themselves to make a good-sized village, run in the direction of Goldthorn Hill in one direction, and in the other towards Merridale Road. Between Steelhouse Lane and Dudley Road the land has also been opened up in a vigorous manner, and a considerable area of green fields of not long ago is now covered with tenements. In the vicinity of the meadow, on the Dudley Road, where the Wolverhampton Wanderers' football team first achieved fame, pleasant villas and homes for the working classes are crowding upon one another, and the inhabitants are multiplying rapidly; while in other parts of the town where the speculator in land and the architect have been most industrious may be mentioned Springfields and the localities intersected by Newhampton Road, Staveley Road and Tettenhall Road. Altogether, taking the comparatively short period of the last nine years, over eight miles of new streets have been dedicated, and at an early date many more of these arteries will be in the hands of the Corporation, while during the same period there have been over three thousand houses erected.

In addition, many buildings of first importance have taken the place of old property or filled up gaps in the main thoroughfares and elsewhere, and have enriched the architectural appearance of the borough. Although the adoption of the artisans' dwellings scheme has proved, from a monetary point of view, a costly experiment, and is even now causing

much heartburning at those unwelcome periods when the rates have to be paid, it must be admitted that it was a municipal leap forward, and has added greatly to the beautifying and importance of the town. Since that time, notwithstanding adverse trade influences, the borough has probably developed at a greater speed than ever before; and if through competition and other causes some old industries are less prosperous than of yore, others have been introduced into the town, and instead of Wolverhampton being a decaying town, there is every reason to believe that it will go on advancing, and not many years hence may occupy a more prominent position among the leading cities of the kingdom. By the improvements effected under the Artisans' Dwellings Scheme the heart of the town has been metamorphosed; the narrow and inconvenient streets which met with such favour among the ancient dwellers in the borough, and the obnoxious slums in their rear, having given place to wide thoroughfares, which are being ornamented with public and business premises, facially as skilfully and artistically designed as the most modern buildings in the leading cities.

Chief among the erections which have added to the appearance of this part of the borough are, in Lichfield Street, the Art Gallery—the gift of the late Mr. Philip Horsman—and its sister institution the Municipal School of Art; the welcome extension, from an architectural point of view, of the old Wolverhampton and Staffordshire Bank; the Victoria, North-Western and Criterion Hotels, the Sir Tatton Syke's block, the Grand Theatre, and in the immediate vicinity the new union offices, the Drill Hall, the School Board offices, the co-operative buildings, and the Vine Inn. The Eye Infirmary has lent an additional charm to the Compton Road; and of other large structures which have been put up of late may be mentioned the Higher Grade and Walsall Street Board schools, the All Saints' Church schools, the Queen Victoria Nursing Institution, and in the same thoroughfare, Bath Road, the Catholic Apostolic Church; the Wesleyan Chapels in New Hampton Road and Ranelagh Road; the Church Institute in St. Peter's Square; while the gas offices now cover the site of a circus in Darlington Street; and of the Corporation buildings may be noted the borough hospital, the weights and measures offices, and the electric-lighting station. Despite the gratifying strides which have been made in the development of the town there is yet plenty of room for additional erections, inasmuch as the area of the municipal boundary extends to 3,440 acres, and a large tract of open space is still available for building opera-

tions. During the last ten years the Corporation have effected desirable street improvements in Chapel Ash, at the corner of Ball Road, in Dunstall Lane, Riches Street, Goldthorn Hill, Great Brick-kiln Street, Dudley Road, Piper's Row, and in laying out the ground fronting St. Peter's Church in Lichfield Street.

Of the larger works which have been carried out by the municipal body for the benefit of the community, the laying-out of the magnificent public park on the tract of land formerly used as a racecourse has been one of the most welcome, and it has given so much gratification to the inhabitants that another people's park at the east end of the town is being provided to meet the wishes of the toiling masses in that part of the borough. This open space will be of the same dimensions as the west-end park—50 acres—and for the gift of the land the thanks of all are due to the generosity of the late Duke of Cleveland and the sitting member for Wolverhampton West, Sir A. Hickman. For some time past workmen have been engaged in levelling and preparing the ground, and it is expected that this welcome addition to the recreation grounds of the masses will be opened during the present year. The population of the borough has grown from 75,738 in 1881 to the estimated total of 86,000 at the present time. Taking into consideration the fact that the population of two adjacent towns between 1881 and 1891 declined owing to the depression in the iron trade, Wolverhampton must have suffered in a similar manner but for the enterprise of many leading business men, who have developed old industries and introduced new ones which have provided employment for many hundreds of additional hands. During the past decade Mr. R. E. W. Berrington, the borough engineer, who is now terminating his connection with the Corporation, has been so actively identified with the municipal history of the town that his share of the work accomplished is sure to linger for a considerable time in the recollection of the inhabitants, as the numerous public improvements he has successfully carried through, added to the model sewerage works which he designed, and the miles of new streets he has made, will all leave marks of his ability and perseverance. Never before has the town shown a better ten years' progress with regard to everything that pertains to public health and general sanitation. There may be much still to be desired, but Wolverhampton can boast of as complete a system of sewerage and drainage and well laid-out outfall works as can be found in connection with any borough in the kingdom. In completing these works the greatest possible difficulties

have had to be overcome owing to the unique position in which the town is situated with regard to the galvanising industry and the trouble which has been caused by the "pickle" being sent down the drains from the various establishments. But for this one cause the rates of the town would have been materially relieved, but, owing to the injury caused to neighbouring estates through the waste acid escaping into the brook adjoining the Barnhurst Sewage Farm, the borough may be said to have been in the law courts for about fifteen years. By a considerable outlay of money in putting down precipitation works at the Barnhurst and a separate system of drainage to carry off the surface-water—works which have been ably carried out by Mr. Berrington—the legal troubles have almost been got rid of, and the inhabitants are now no longer in fear and trembling lest the Corporation mace should be seized as the outcome of the litigation which arose over the sewage question. During Mr. Berrington's tenure of office he has done much to improve the sanitary condition of the dwellings of the working classes, and has expended a large sum in demonstrating the reliability of the waste-water closet system as an efficient sanitary appliance, and which is likely at no distant date to supersede the present objectionable pan system, which has been not only extremely costly, but owing to various defects in the method of carrying it out has created such a great amount of opposition to it in the town as to cause municipal candidates to make it one of the principal planks in their programmes. It is needless to enumerate the whole of the works which have been carried out by Mr. Berrington during the last few years, but we may say that the town will have no cause to complain if the work of the engineering department during the next ten years is carried on with as much ability as it has been during the retiring engineer's term of office.

So far we have dealt with the growth of the town during the past fifteen years, but it may not be uninteresting in a few words to refer to some of the leading improvements which have been effected since the incorporation of the borough in 1848, when Mr. G. B. Thorneycroft was chosen as the first mayor. Only a short time previously, when Mr. C. P. Villiers was elected as member for the borough, the population was about 25,000, the Whitmore Reans district, now so populous, was a farm, Waterloo Road had not been made and Heath Town was in reality a "heath." There were then only three churches, and the site of the Agricultural Hall and a large part of the eastern division of the town was garden ground. Since the

LONDON, W.C.

advent of the Corporation they have kept pace with the progress of sanitary science, and the result has been that the conditions of life in the town have become far more favourable to health and longevity than was formerly the case. The Wolverhampton baths, erected by a joint-stock company in 1850, have been acquired by the municipal authority and greatly improved. The Market Hall, which cost 30,000*l.*, was opened in 1853, and has not only been a boon to the town, but it yields a valuable revenue which goes to relieve the rates of the town. A cattle market, covering an area of 4½ acres and providing accommodation for nearly eight thousand animals, was also provided by the local parliament, and not far away in Garrick Street, what was once the police-station has been changed to a Municipal Free Library, with its lecture room and class rooms, and where an educational process is going on that cannot be overvalued. The Town Hall, erected under the eye of Alderman Walker at a cost of 19,000*l.*, exclusive of the site, was opened in 1871, and in Queen Street the Government have provided a county court and a post office; but in the course of another year it is expected that the business of the latter institution will be removed to the new building now in course of erection in Lichfield Street. To private speculation the town is indebted for the Exchange, built in 1851 at a cost of 15,000*l.*; the Agricultural Hall, which was opened at a cost of 6,000*l.* in 1863; and the cemetery, which has had a sanitary effect on the town, in preventing further interment in the overcrowded churchyards of populous neighbourhoods. The cemetery was formed under an Act obtained in 1847 by the proprietors, and cost about 10,000*l.* Another institution which gains in respect as it grows older is the Wolverhampton and Staffordshire Hospital, on the Cleveland Road, which was erected by subscriptions, and cost about 15,000*l.* The Wolverhampton Orphan Asylum, on Goldthorn Hill, is also one of the noblest institutions of its kind in the country. Its original cost was more than 30,000*l.*, but many improvements have since been effected, and there will shortly be opened in connection with it a new chapel. Few institutions are doing better work for boys and girls deprived of their nearest relatives, but donations to the charity are greatly needed in order to extend its operations. Other references might be made to the progress which has been made by the borough during the past fifty years, but we have said enough to show that Wolverhampton during that period has grown to what it is now from small dimensions, and that it is up to date and is likely to keep pace with the times.

COMMERCIAL VALUE OF PEAT.

AN industry that is likely to prove the means of greatly enriching that poverty-stricken country is about to be introduced into Ireland shortly by a body of financiers. After many years of experiments, conducted for the most part in Holland, where an experimental factory has been in operation with marked success, a process of utilising peat and making it valuable for various commercial purposes has been discovered. In the past peat has been used merely as fuel, in which form its commercial value has been at the very most only a few shillings a ton; and as moss litter, in which form it has earned large dividends for the shareholders. By the present process, however, it assumes great importance, and cannot fail to effect a revolution in more than one branch of trade. Peat, as is well known, consists of two varieties—red peat, which is that which lies uppermost, and black peat, that is found immediately underneath the red. The red is fibrous in nature, and by the process to which we refer that fibre is combed out until it resembles wool, and then woven into either cloth, which is half the cost of and far more durable than shoddy; or matting and rugs, it being possible to sell the latter at a good profit from a shilling retail. The remarkably good face the cloth possesses is shown by the fact that last week, at the Irish Industries Exhibition, held at the residence of Earl Fitzwilliam, 4 Grosvenor Square, the Duchess of York was so pleased with it that she bought sufficient for a dress, while the Duke ordered a shooting suit of it to be made for him. Not only is the fibre of commercial value when refined by combing, but the waste product, bleached by the patent process, is utilised as peat pulp, and possesses all the properties of wood pulp, at the same time being very much cheaper. Lastly, the dust produced in the course of the refining is possessed of valuable disinfecting qualities, and can be sold to advantage. The black peat, like the red, can also by the process be rendered a source of large revenue. It is reduced to a powder, and then by compression formed into solid blocks that are a perfect counterfeit of ebony, and can be used for all the purposes for which that wood is available. Further, unlike ebony, it is very hard and not brittle, and thus can be worked up in the form of pistol handles, panels, pulleys, &c., and, as it is a non-conductor, electric appliances. Up to the present the patents have been worked only experimentally at the factory in Holland, whither the peat has been exported; but now that perfection has been arrived at, and a financial success insured,

the patentees intend erecting a factory in Ireland and commencing the manufacture of the products on a commercial basis. A company, we hear, is now being formed for the purpose of introducing the system to the English public. Meanwhile, any information can be obtained on application to Mr. H. W. Christmas, 42A Bloomsbury Square, who is acting as the solicitor to the company.

BUILDING IN EASTBOURNE.

THERE is some uncertainty in Eastbourne about the taking over of some new roads on building estates by the Town Council as public highways. The highways and drainage committee, after visiting the following roads on the Compton Place building estate—Tower Place and Latimer Roads, roads on Redoubt Estate, Ashford Square, Paradise Drive, Link Road, Carlisle Road (upper part), the Duke's Drive, Denveon and Gaudeck Roads, Warley Road, Milnthorpe, Dalton and Chesterfield Roads, Buxton Road, Staveley Road, Mount Road, South Cliff, St. John's Road, Fairfield and Silverdale Roads—decided that they were prepared to recommend the Council to adopt them as highways providing certain works were carried out. The committee also instructed the town clerk to inform the agents of the Compton Place and Gilbert building estates that in consequence of the expenses caused by leaving green spaces on the outsides of the pavements the Council would refuse to take over such roads in future, and suggest that they be paved and small spaces left around the trees. The committee received a request from the agent to the Compton Place building estate to reconsider their decision as to not adopting roads as public highways when the borders of the pavements were turfed off. The committee resolved to decide each case upon its merits after receiving a report from the borough surveyor. A letter was read from Mr. H. Michell Whitley accepting the conditions imposed by the Council as to the completion of the roads on the Gilbert estate before adoption. Mr. Whitley urged that the Corporation should pass the plans for new roads at Upwick submitted a long time ago, he being willing to abide by the arrangement made in 1893, and that the estates should construct a surface-water sewer 12 inches in diameter from the Bourne stream of the Star Brewery to Upwick, although the borough surveyor then stated that it was not required. The committee requested the borough surveyor

to consult with Mr. Henry Law, C.E., as to what was necessary to be done in regard to surface-water and sewerage, and prepare a scheme for the consideration of the committee.

NEW YORK ARCHITECTURE.

IN the *World*, of New York, Mr. Barr Ferree writes:—The city of New York is the one great city of the world which is entirely deficient in buildings of real architectural interest, grandeur, magnificence and taste. Of costly buildings we have no end; of big ones no limit; in pretentiousness we are unequalled; in costliness of structures erected by private enterprise we are unrivalled; but none of these things, separately or together, make architecture or help to endow our great city with that splendour and taste which by her position, her culture and her wealth she is entitled to.

An architectural chaos reigns in New York as it reigns in no other city upon earth. Nowhere are there so many bad buildings, nowhere is there so wanton a disregard of the simplest requirements of art and of good taste. Wealthy corporations, men of culture and of wealth, people who are familiar with every resource of our civilisation, who have read largely, travelled widely, studied the world's masterpieces of art in every form, come to the metropolis of America and befoul its streets with structures that are absurd when they are not ugly, that are preposterous when they are not frightful, and that violate all the canons of good taste.

Once it was necessary to go to Philadelphia to study examples of the utterly horrible in architecture; once Chicago was the laughing stock of the world for the idiosyncrasies of its buildings; but New York has long since outstripped these towns in the nightmares in brick and stone and iron that have been built within it.

One has but to look—the street and the location matters not—to see examples of the very worst architecture in the world. On every side these buildings flaunt their horrors in the eyes of a defenceless public, clamouring for attention and bellowing for notice, so complete and astonishing is the mixture of their parts.

What is a New York business building but a conglomeration of structures of different design piled one on top of the other, and mostly without regard to the harmony of the oddly assorted portions? What is a New York apartment-house but a similar museum that only differs from the business

No. 2.—AUTOMATIC SELF-LOCKING ACTION.

No. 3.—THE SELF-HELP FASTENER.

A large number already in present use giving full satisfaction

COMBINED STAYS AND FASTENERS FOR CASEMENTS AND FANLIGHTS.

WE beg to call your special attention to our Patent Combined Stay and Fastener, which, from its great advantages and easy mode of use, can well claim a superiority over the common kinds. You will notice that this Fastener has no complex system of working, is easy to fix, and whether the casement is open or shut, does not project into the room, but hangs down the centre of the sash free from curtain or blind. The advantage of this Patent Fastener is that, being fixed in the centre of the sash, it affords protection against sudden gusts of wind when open, and keeps the sash safely closed when shut, as it acts as a fastener for the casement as well as a stay. Each of the three kinds of Fasteners affords the same advantages in all respects, as, though varying in shape, size, and price, are only different ideas of the same method. These Casement Fasteners can be used both for wood or iron, for single or double casements. The special pattern is used for fanlights to open outwards, and all can be used both for right or left hand. We can supply these Fasteners in any number of links, according to the extent the casement is required to be opened. We may also note that the Fasteners are well made and finished, can be had both in brass and iron, and are, therefore, well suited for any kind of residence. Quotations and further information will be given on application. Also testimonials. Please state in ordering whether you require them for single or for double casements.

Stay and Fastener shown in Action.

building in being put together with less regard to relationship in the individual specimens? What is a New York dwelling but a slender slice, whose variety is often the cause of its failure? What is any great structure in New York but a horrifying example of what ought not to be and yet which is and cannot be got rid of?

No corporation in New York is housed in a structure that is artistic and beautiful, sober, orderly and scholarly in meeting the requirements of modern commercial life. No man of great wealth is here housed in a residence such as his means would justly entitle him to have and which might well be a rich and beautiful adornment to our city. Our public buildings are too scandalously ridiculous to be thought of as architecture in any sense.

This architectural chaos, this turmoil of building, this accumulation of architectural monstrosities and absurdities is the direct result of the crudeness of the public taste. In a community where art is measured by cost, where beauty is estimated by the rareness of the materials, where proportion is not understood, where architectural fitness and propriety are unknown, the buildings cannot be other than dreadful, the architecture anything but distressing.

A building is not a fine piece of architecture because it is big and high and has cost a million or two. These things have nothing to do with art. But in New York and elsewhere in America it is popularly supposed that if a building has cost a million it must be fine. True, it should; but a hundred examples in our city prove the contrary.

The architects are as blameable as anybody. These delightful gentlemen, who should know what good architecture is and how to make it, who assume that responsibility and stand before the world as the creators of our buildings, have often as little an idea of the work they are trying to do as the newest draughtsman in their offices. The best of them will, if he gets the chance, do the most dreadful thing the human brain can conceive of in architecture. And he expects to be praised for it.

The client, possibly with boundless resources at his command, will time and again assent to the most dreadful designs, because he knows nothing of architecture and its application to the necessities of our civilisation. Then the critics, coming out of their shells, tell their friend the architect he has done a masterly thing, which, perhaps he has, in badness. And the poor populace is dazed at what it sees and hears, and no wonder.

Are we improving? Is our architecture better than it was a quarter of a century ago? Is it bettering every day?

The architecture of New York is more varied than it was twenty-five years ago; it is bigger, richer in materials, more costly, more pretentious, more self-assertive. The architects have larger opportunities of doing large things, and when they make mistakes and design badly, and do the things they ought not to do, their sins are magnified a thousandfold.

Architecture runs close to fashion, and our windows and doors, our cornices and roofs, vary in height, in width, in shape, in positions very much as women's fashions change, without reason. If cornices are worn low this year we may look for them higher next season. And that is about all the progress we are making in architecture as it is watched from year to year.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ADVERTISEMENT SCALE.

At a meeting of the executive committee of the Association for the Promotion of Art and Music in the City of Glasgow a report from the architects was submitted, showing that the basement floor of the New Art Galleries at present in course of erection in Kelvingrove Park will be finished in about a month, and that the work done up to the present time has been thoroughly well executed. It was decided by the committee to advertise for tenders for the superstructure and completion of the building.

Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

TRADE NOTES.

AN elaborate altar front in carved oak has been presented to the parish church of Glossop, and was used for the first time on Trinity Sunday. The design comprises a series of carved open work tracery panels divided by buttresses and pinnacles arranged so that the frontals for the various seasons can be slid into a groove behind the embroidery filling up the panels. At each end of the front are exquisitely carved figures of SS. Chad and Aidan, bearing shields with the arms of Lichfield and Durham respectively. The frontals of white and red silk with elaborately embroidered floral devices form part of the scheme, and were supplied at the same time. The whole of the work was entrusted to Messrs. Jones & Willis, of 79 Edmund Street, Birmingham.

THE Chell Workhouse Hospital, Tunstall, now in course of erection, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, some with ascending and some with descending smoke flues, and also by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

TENDERS for erection of police-stations at Culter, Ellon, Strathdon and Inch have been accepted by a sub-committee of the standing joint committee of Aberdeen County Council. The four new stations will cost about 3,000l.

AT the meeting of the Walsall Town Council, a recommendation of the streets committee was approved advising the acceptance of three tenders, viz. one of the Asphalte Limestone Concrete Company, Limited, to provide and fix about 12,000 superficial yards of limestone asphalte in various streets and roads, at 1s. 4d per superficial yard; one of Mr. James Atkins, to provide the labour and haulage required for the laying of 7,000 superficial yards of blue bricks for the sum of 8d. per superficial yard; and one of Mr. J. Hamblet, of West Bromwich, for the supply of the blue bricks required during the ensuing year at 2l. 14s. per 1,000. The health committee reported, among other matters, that a house-to-house inspection had been made of 1,919 houses in certain streets which were specified.

AT the quarterly meeting in Kendal of the Westmorland County Council, the county surveyor, Mr. Bintley, reported that the cost of repairs to and maintenance of the main roads, bridges and approaches thereto for 1894-95 had been 11,917l. The cost of cutting and clearing away snow during the severe winter had been a heavy item in several parts of the county.

THE Darlington Town Council have decided that tenders should be invited for the erection of the Technical College.

AT Ayr it has been decided to construct two additional filters at Knockjarder, at an estimated cost of 1,600l. It is stated that at present there is a great waste of water, and rate-payers are recommended to be careful. The rainfall during the month of May was 0.73 inches.

FOR the building of the church of Holy Innocents, Selhurst Road, South Norwood, to be opened on the 19th inst. (Messrs. Bodley & Garner, architects, and the builders Messrs G. F. Smith & Sons, Milverton, Leamington), St. Aldhelm Box ground and Corsham Down stone, from the quarries of the Bath Stone Firms, Limited, Bath, was supplied.

ELECTRICAL.

AN inquiry has been held at the Yarmouth Town Hall relative to the application for a further loan of 17,500l. on account of the electric light scheme. It was explained that the first loan for the electric light was for 16,000l. and that this was followed by another of 1,500l. to make good the deficiencies in the first estimate. Of the present application 2,000l. was for connecting up 150 customers and 15,500l. was for extensions to plant.

THE distribution of electricity for power purposes in St. Louis, U.S., is, it is stated, furnished by three companies. It has replaced steam in hundreds of small manufactories and elevator services, but it is in connection with street railways that it has accomplished its greatest work. There are nine companies operating 275 miles of single track, running 500 motor cars, with 20,000 horse-power of electrical equipment and 600 trailers. There are eight power-houses with a total electrical equipment of about 23,000 horse-power.

AN extension of the electric-lighting system in Aberdeen has been agreed to by the gas and electric committee of the Town Council. The mains will now be laid along Bridge Street, a number of applications for supplies of current having been lodged from occupiers of premises in that thoroughfare.

AT Ayr the extension of the electric mains, it has been intimated, will cost about 990l. It is expected the current will be available by the beginning of September.

THE members of the Leeds Association of Engineers have paid a visit to the central electric-lighting station of the Yorkshire House-to-House Electricity Co., and inspected the recent

London Office: 18 VICTORIA ST., WESTMINSTER.

"MANCHESTER" DYNAMO.

extension of the plant. Two 400 indicated horse-power horizontal compound condensing Corliss engines, with cylinders 19 inches and 36 inches in diameter, by 3 feet stroke, have been added, built by Messrs. Hick, Hargreaves & Co., of Bolton, and fitted with their high-speed gear. Each has a fly wheel 17 feet in diameter, weighing 18 tons, from which is driven by means of ropes a 200 kilowatt Hall dynamo of the multipolar alternating current type, having 7 tons of revolving magnets and sectional armature. The dynamos work with remarkable smoothness. The total power capable of being developed by all the dynamos is 700 kilowatts, but the foundations are nearly finished for another 400 horse-power engine by Messrs. John Fowler & Co., Leeds, fitted with the Marshall-Wigram gear, which will raise the total electrical power to 900 kilowatts. The working pressure in the mains is 2,000 volts, and the dynamos are self regulating within about 15 per cent. The company began business two years ago with 4,000 lights on circuit, and they have now 26,000 8 candle-power lights. The boiler-house contains six Lancashire boilers, 30 feet long by 8 feet diameter, having mechanical stokers, feed water heaters, &c., and each capable of evaporating 8,000 lbs. of water per hour from 212 degs. Fahr.

VARIETIES.

A SCHEME for the removal of an unhealthy area in Hull is under consideration by the unhealthy dwellings sub-committee of the Corporation, as to the expediency of declaring insanitary a very large area, extending practically from Lower Union Street, through Trundle Street, to Waterhouse Lane. The scheme is an extensive one, and beset with difficulties; but perhaps the chief difficulty which will have to be faced is as to what shall be done with the property when it is declared as unfit for human habitation, for it appears that while the Corporation have power to close the dwellings in the locality, they cannot remove them.

THE sanitary committee of the Manchester Corporation have recommended that an application should be made to the Local Government Board for power to borrow 12,000*l.* for the purposes of the Manchester Dwellings Reconstruction Scheme, 1891.

AN inquiry has been held at Failsworth into the application of the Council to borrow 9,000*l.* for works of street improvement.

AT Burslem a public inquiry has been held with respect to an application by the Town Council for sanction to borrow 6,500*l.* for the purposes of public walks and pleasure grounds, 3,130*l.* for street improvements, 1,250*l.* for works of sewerage, and 128*l.* for the redemption of certain tithe rent-charges.

NOTIFICATION is given of an intended application to Parliament in the present session for leave to bring in a Bill and to pass an Act to extend and apply the provisions of the Joint-Stock Companies Arrangement Act, 1870, to the Kent and Surrey Permanent Benefit Building Society, in the same manner as if it had been a company liable to be wound up and were in course of being wound up under the Companies Act, 1862. The Bill will contain clauses conferring on the judge of the court in which the winding up of the affairs of the Society is proceeding the powers given to the court by the Act in question, and providing that, "for the purposes of any compromise or arrangement, all persons who have deposited with or lent money to the Society, and whose deposits and loans have not been repaid, shall be deemed to be creditors of the Society."

WITHIN the last week serious fires have been reported from various parts of the country. In the dry and hot weather of late experience more than ordinary care should be exercised. Windows and doors have to be kept open to mitigate if possible the effects of the hot weather, and in case of an outbreak every inlet afforded to the outside air must help to fan a fire.

PART of the extensive cotton manufacturing works of Messrs. R. Haworth & Co. in Ordsal Lane, Salford, have been destroyed by fire, which broke out in the "beam shed," a large building in which cotton in various stages of manufacture was stored. Damage to the amount of from 15,000*l.* to 20,000*l.* was caused.

AT Yarmouth a fire broke out in a large block of premises in the possession of Mr. J. R. Swanston, in close proximity to the Artillery barracks. The water supply was inadequate, and the buildings, valued at 10,000*l.*, were destroyed.

THE brush factory at Pontefract of Wigfall & Sons was, on Tuesday, demolished by fire, damage being done to the extent of 15,000*l.*

AN owner of houses at Fulham was fined 10*l.* and costs at West London Police Court on Tuesday, for failing to supply them with a proper water supply until they had been occupied for some months.

THE long-continued drought and the increased consumption of water in Glasgow during the last few weeks have seriously affected the sources of supply.

BUILDING AND BUILDERS.

At the meeting of the Partick Dean of Guild Court, Messrs. Alex. M'Ewan & Sons, builders, Partick, were granted lining to erect seven tenements of dwelling-houses in Church Street and Thomson Street, the estimated cost being 8,000*l.* Peter M'Kissock & Sons, to erect a villa in Park Gardens North at a cost of 1,200*l.*, and twelve self-contained houses in Crow Road at a cost of 3,000*l.* George Anderson, builder, Whiteinch, to erect four cottages in Park Street, Whiteinch, at an estimated cost of 1,200*l.*

At a special meeting of the general committee of the Walsal Hospital, plans were adopted for the restoration of the buildings which were wrecked by the late gale, and the addition of others, at a total estimated cost of 2,700*l.*

At the fortnightly meeting of the Paisley Dean of Guild Court, a warrant was granted to the directors of the Industrial School to erect a dining-hall, gymnasium and swimming-bath at the Industrial School, Albion Street.

In the Govan Dean of Guild Court a lining was granted to Messrs. Speirs & Co, Glasgow, to erect a Congregational mission hall in M'Lellan Street in connection with Trinity U.P. Church. The hall will seat 240 people.

The Peterhead Police Commissioners have decided to erect a model lodging-house, capable of accommodating fifty lodgers, at a cost of 1,250*l.*

At the holding of the Ayr Dean of Guild Court warrants were granted to David Campbell for a villa in Blackburn Road, and to Robert Harvey for a villa in St. Leonards. The burgh surveyor reported that during the past year seventy-nine linings had been granted, as compared with seventy-eight in the previous year. The fees paid were 63*l.* 8*s.*, as against 63*l.* 7*s.* 6*d.* for the preceding year. The value of the buildings passed by the Court was 72,000*l.*, an increase of 4,000*l.* over the previous year.

The Crewe Tradesmen's Association have asked the Town Council to adopt a more moderate scheme than erecting an isolation hospital at a cost of 8,000*l.* The request cannot be entertained, as the proposed hospital will only provide accommodation for present requirements.

In the Edinburgh Dean of Guild Court eleven out of twenty applications for various buildings were passed.

"SANITAS."

UNDER the above title, the Sanitas Company, Limited, of Letchford's Buildings, Three Colt Lane, Bethnal Green, E., have published an excellent brochure on "Sanitas" disinfectants and appliances, with an historical sketch relating to them (including directions as to their use), and the science of disinfection. Many medical and other expert reports are embodied in this work, which show that the labours of the company in sanitary directions have been universally appreciated. We can well commend this little work to perusal, not only by those mainly responsible for securing the best sanitary conditions for their clients, but by the general public as well. The company have evidently paid great attention to what nature has provided in the way of disinfectants, though nature has left us to exercise the necessary amount of skill and invention to utilise them, in much the same way as medicines and drugs are obtained from mineral or vegetable sources. Localities in the neighbourhood of pine forests have long been supposed to be of exceptional advantage from a health point of view; also the ozone from the sea. The eucalyptus, or gum-tree, as it is popularly called in Australia, has been often planted in malarial districts, with the result that lands hitherto useless, and on which no one could reside, are now inhabited and under cultivation. We have, then, mentioned three among other of the valuable sanitary agents, and the natural sanitary products have been so ably dealt with that they are combined with a variety of other substances, and also in a variety of forms, that bring them into practical use. These varieties have, of course, separate names to denote their special functions, viz. Sanitas fluid, Sanitas oil, fumigating candles, powders, &c. Filters, among other things, are provided. The Sanitas soap we might call special attention to, as it is just brought out. In conclusion, it may be remarked that the range for use of these combina-

tions is wide. They are not only intended to keep houses, &c., in a perfect sanitary condition, but extend to the curing of diseases, also are beneficial in consumption, excellent for animals, freeing them from mange and the attacks of vermin, most useful in laundries, &c. The soaps, among other kinds, include toilet soap, family soap, dog soap, soft soap, soap powders, &c. A number of excellent testimonials are also given.

TENDERING IN VICTORIA.

PERHAPS there is one paragraph in Mr. Blackburne's annual address to the Architectural and Engineering Association of Victoria which commends itself, says the *Building and Engineering Journal*, more strongly than any other to public consideration, and it is this:—"One of the unsettled questions in all Institutes is, Whether the architect is entitled to be paid the fair value of the work when a contractor takes it far below the real market value, as in many instances is done, as he has in reality a greater anxiety in the supervision to secure his client proper work?" It is astonishing how many of the professional men—of Victoria especially—lend themselves to a suspicion of participating in "hole-and-corner" work by refusing information to the Press upon the tenders sent in for various contracts, and, as a rule, it is these firms with whom many builders have experienced such bitter trouble and such ruinous losses. The publication of tender-lists sanctioned by the Parliament of New South Wales has already given the greatest satisfaction, and is the best protection possible against fraud and corrupt practices. Every firm of good architects is either bound strictly by his client's limit of costs, or with his sketch-plan gives them an accurate total estimate of value before preparation of specifications; they then honourably prepare these specifications to fill to the client's best advantage the limit of cost, and in so doing calculate a fair percentage of profit for the builder. Then tenders are called for, and out of thirty sent in for a 2,000*l.* or 3,000*l.* contract there will be found a difference of many hundreds of pounds, and as a rule—*veritas in media*—it will be found that the one nearest the average amount is as nearly as possible the fairest tender of the whole number—that is, the highest amounts are "grabs" of chance at a lucky haul, and the lowest too frequently the desperate plunges of builders who, having nothing whatever to lose, "cut" the price, and trust to Providence to raise the materials for them, which, as is too well known, are frequently never paid

for, the first draw being the signal for collapse, or even disappearance of the builder. If this be not the case, then a still more distressing reason may be found in some omission or error of the contractor who too late discovers this, and is caught fast in the meshes of "Conditions" already duly signed. How many such instances could we not record in the past few years? By the publication of the tender lists there is a great safeguard raised for the builder and for the merchant, because a very fair estimate of cost is always obtainable, and a man who "cuts" desperately would be shunned by the merchant if he sought credit. If the architect snatches at a low estimate in his client's interest to curry favour with him he does a dishonest thing, because having computed the value it becomes evident to him that there must be some error or dishonest intention in such an estimate, and by adopting it he "conspires to defraud." The puzzle is in these matters why the architect should in adopting these estimates forfeit a portion of his own remuneration by the loss of commission; but perhaps there is often the weakness of "being thought clever" by his client to tempt him in this direction in a lively anticipation of favours still to come from the same direction. Mr. Blackburne does not suggest a cure for this trouble, and looks at it only from the point of view of an architect who would yield to the will of his client against his own conscience, and thereby become an unwilling sufferer by the carelessness or dishonesty of the builder. Happily, we think, such instances are rare; and the client who trusts his affairs to a firm of good architects would in such a case also be guided by their assurances that the lower estimates were too low. Unfortunately, a scarcity of work induces this cutting of prices, and it would not do to judge all cases by any one instance of dishonesty, because there are firms of contractors who have perhaps stocks to clear, a special facility for buying or producing, who will work at a very low rate to "keep the mill grinding." Such instances are for the advantage of the client, and, provided the architect is assured that there is ample guarantee of the contract being completed, he is bound to watch his client's interests, and accept the opportunity, even if it should cut against his own remuneration in commission returns. Still, however, we get back to the same sources of these evils, the suppression of tender lists by architects, which are well known to have encouraged and cloaked many wrongs, and resulted most disastrously to builders and merchants. It is fair to every tenderer to know how he stood as against other competitors, and every claim on behalf of honesty and honourable conduct may be urged in favour of publicity, and

every condemnation of wrongs which are cloaked or rendered possible under the suppression of such information. The English practice of accepting the tender which is nearest the average price and estimate of cost is by far the safest system, and it would surmount all difficulties, rare though they be, which are suggested in this isolated but very important paragraph in Mr. Blackburne's address.

SAFETY APPLIANCES FOR ELEVATORS.*

ALTHOUGH numerous papers on lifts have been read and discussed at meetings of the different learned societies and institutions, the accessories have never received any other than the merest comment. The author has therefore selected the details of safety appliances as the subject of the present paper, as he considers it of the utmost importance. With the memory of the sad death of a member of the profession in his mind, the author offers no apology for the subject of the paper; but the contents are another matter, and on this score he would crave the indulgence of the meeting.

The first weak point in hydraulic lifts, which is patent to all, is the effect of any hammer action that arises when the machine is stopped or started suddenly. This shock is in no way transmitted to the mains, as consumers are always required (where the supply enters their premises) to fix a valve which shall not only act as a stop-cock but also as a back pressure and retaining valve, in order that any failure in the power supply will not affect the machine so as to cause it to descend. This stop valve thus concentrates any shock on the pipes within the building, and they have to bear all the sudden increase of pressure. To relieve this stress to which the pipes would be subjected, relief valves are sometimes fixed, although the author ventures to think not often enough. In direct-acting and suspended lifts the danger resulting from any pipe connection breaking is infinitesimal, since diaphragms are, or should be, always placed in the joint next the cylinder in order to regulate the speed of the lift in its ascent, and this will similarly prevent any excessive velocity of the cage when descending. The orifice in this diaphragm should always be well tapered on both sides so that the loss of pressure may be minimised to, say, 3 per cent.

* From a paper by Mr. H. W. Umney, read at a meeting of the Society of Engineers on June 10, 1895.

When the well-known Paris accident brought about the abolition of the practice of balancing the dead weight of the ram and cage in direct-acting lifts by overhead gear, and the introduction of hydraulic balances, makers who hitherto had considered this class of lift inherently safer than those which depended upon the support of chains or ropes, did not hesitate to state that they were now absolutely safe. In water-balance lifts, however, the diaphragm to regulate the speed of its ascent is of necessity put into the power cylinder, and is therefore not such a protection from risk as in the case of a simple direct-acting or suspended lift; for it is impossible to place any diaphragm in the connection between the hoisting and balancing cylinders. Hence should the pipe (which is usually 2 inches diameter in order that the water may oscillate freely) fail, the full weight of the ram, cage and passengers act to force the water out of the cylinder. To provide against the obviously disastrous effects consequent on the failure of such a pipe, ram grips were made of various designs.

Grips, however, were not considered by Sir Frederick Bramwell sufficiently reliable for the safety of passengers travelling in direct-acting hydraulic lifts fitted with water balances, so he required that a brake-valve should be made and fitted on the four lifts at St. Bartholomew's Hospital in order to minimise any risk. The valve is fixed as near as possible to the lifting cylinder. Under ordinary working conditions the pressure on either side of the valve does not vary more than 20 lbs., so that a light spiral spring will easily keep the valve open. Should a pipe burst the pressure on the upper side of the valve is relieved and the valve closes, leaving only a small hole for the water to escape through. This hole is usually about a quarter of an inch diameter, so that the sudden closing of the valve does not cause any shock, and the lift is enabled to descend gradually. The author then showed the effectiveness of a diaphragm (and this valve merely acts as one) by computing the speed at which the lift at Lloyd's Registry fell compared with the rate that it would have descended if fitted with only such an orifice as was necessary to obtain the maximum speed of ascent. If the ordinary 2-inch pipe connection, without such a diaphragm, between a balance and hoisting cylinder, were to break, the speed at which the lift would descend would be not less than sixteen times as great as usual.

Having referred to diaphragms as a safeguard from pipe failures, the author next directed attention to gear fitted on cages so as to arrest their motion when the hauling chain or

ADDRESS—

P. A. GILBERT WOOD,
175 STRAND,
LONDON, W.C.

ropes fail. In one of the earlier arrangements the cage is made with a strong angle-iron frame suspended from two flat plates by bars and tie-rods in order to insure rigidity. In the centre between these plates, to form a means of suspension, a flat eye-rod is passed and held on the under side by a spring and nut. On either side of the cross bars are shafts, fitted at both ends with serrated cams, and at the centre levers are keyed. Each of these levers is connected by a pair of links to the eye-bolt, so that when the cage is suspended the spring is deflected and the levers raised, so as to free the cams from the guides between which the lift runs.

When the hauling chain breaks the force of the spring rapidly pulls down the eye bar and the cams grip the tee irons, which in this case serve as guides. A modification of this arrangement is where, instead of cams to grip the runners, spikes are forced out into the guides. With these gears, however, it is necessary that the guide bars should be of a very rigid construction to resist the thrust of the arms. Safety gear is now hardly ever fixed on the top of cages, because it is then necessary to construct a far heavier frame than would be required to carry the load, lest, under the dynamic stress resulting from the motion of the lift being arrested by the safety gear, the bottom of the cage should fall out, as it did in one instance which came directly under the author's notice. The exceptions to this form of construction are few, except when the load is considerable and the goods bulky.

With improvements in steel wire rope manufacture the lifting chain gave place to a rope, and the single rope in the case of a passenger-lift to two or four ropes. This greater number is now most common, and the author would here trespass for a moment on ground which received but a cursory glance from Mr. Carey, in his interesting paper on "Hydraulic Lifts," read before this Society on June 5, 1893. The author has no hesitation in asserting that when four ropes are used they should each and every one bear an equal share of the work for the reason that, should any pair of ropes be made to carry the load, those running idly would depreciate by constant bending to such an extent that when suddenly called upon to bear the burden the dynamic stress would be too great for them, and the cage would be left to the action of the safety-gear. If a rope under tension is bent round a pulley, the resistance will be that due to the bending of the individual wires as beams, plus that due to the increased stiffness given to the wires as a whole, on account of their being laid into one another. The resistance to bending, on the part of the individual wires, is

highest where small pulleys are employed, and bending in these cases is often the direct cause of by far the greatest separate longitudinal stress in the wires themselves.

The size of rope commonly used for lifts is $1\frac{3}{4}$ inches circumference, composed of thirty-six wires of No. 20 B.W.G., with a modulus of 33,000,000 lbs. The calculated stress in tons per square inch on each wire due to bending round a 24-inch pulley is no less than 22 tons, which is increased to 50 tons on a 10 $\frac{1}{2}$ -inch pulley.

Again, the life of ropes made in the ordinary way is not more than one-half that of those in which the wires are laid in the same direction with the strands, on account of the cutting action of the wires on one another, but which is reduced to a minimum in the type of rope known as Lang's lay.

A consideration of the conditions under which a portion of lift ropes work will show they are not too favourably used, but are subject to reverse stresses whereby the life of the rope is reduced by one-half. The size of pulley required for such a rope as indicated by theory, according to Professor Unwin, should be 28 inches, and this agrees with that determined by calculation from an empirical formula made by Professor Goodman to suit these practical experiments ($N. + 35,000$) ($27.5 - D$) = 880,000, where N. is the number of bendings necessary to cause fracture and D. the diameter of the pulley in inches. Thus when N. = infinity, D. = 27.5 inches. It will therefore be seen that manufacturers of lifts do not far transgress by using a 2-foot pulley in order to insure that the ropes do not wear out rapidly.

Now as regards the practical application of these remarks. How often should lift ropes be renewed? If a rope of Lang's lay, the size quoted, be not oiled it will stand 75,000 reverse stresses under a tension of about 15 cwt., and this will point to the advisability of changing the ropes every three years, in the case of a lift making two hundred journeys per day. He then described one of many arrangements of the gear now usually fitted to cages which showed a new departure in the principle underlying its efficiency, depending as it did on the increased tension of any one rope out of a number which may be employed.

After mentioning the remote possibility of all the lift ropes failing at one and the same time, he drew attention to the fifth rope adopted by makers, of which he approved when applied also as a means of checking any excessive speed of the lift while at work. He then illustrated the passing of such a rope round a governor, and also another means of attaining the same object

in a simpler way by passing the rope over a pulley and attaching it to a small weight, which would actuate the gear by virtue of its inertia when the speed of the cage became abnormal. He pointed out that this latter arrangement acted very well as a safety gear by itself, since its effectiveness varied not merely as the velocity, but as the square of the velocity of the falling cage. He also observed that this gear could be made still more effective by making the weight pass up and down a closed tube which it fitted fairly tightly.

THE CORPORATION GRANARY, GLASGOW.

DAMAGE to the estimated extent of 12,000*l.* was caused by a serious outbreak of fire on the 5th inst. in a granary belonging to the Glasgow Corporation Tramway Department, and situated alongside the extensive Kinning Park stables in the south-west district of the city. The stables and granary, says the *Glasgow Herald*, were handsome buildings, completed a little over a year ago. Two storeys in height, and constructed of brick, the stables and car sheds cover an area of 80 by 50 yards, and have tasteful elevations to St. James's Street and Great Wellington Street. The granary, where the fire occurred, was separated from the other buildings, and was a five-storey brick erection, about 80 yards long by 20 wide. Its frontage was to Park Street, and extended from St. James's Street to Great Wellington Street. The eastern portion was used for the storing of grain and the western section for the storing of hay, while the central part of the building contained the machinery for the bruising of the grain, the cutting of the hay, and the mixing of the hay and grain in the proper proportions for horse food, preparatory to the daily distribution of the stuff to the several districts. About five or six weeks' supply could be stored in the granary at a time. The buildings throughout were lit by electricity, and as a protection against fire the partition and outer walls were of great thickness, while iron took the place of wood in the construction of the building wherever practicable.

The fire broke out in the western portion of the granary, where the hay and straw were stored. This part of the building was some 110 feet long by 60 feet broad and 60 feet high. It had an outer wall 2 feet 8 inches thick at the bottom, and gradually decreasing in thickness towards the top, and was separated from the machinery department by a division wall

2 feet 9 inches thick, pierced by iron doors on each flat. Some idea of the size of this portion of the granary may be gathered from the fact that there were no fewer than 192 windows facing Park Street, forty facing Great Wellington Street, and sixty-four looking into the stable-yard at the back. The outbreak was discovered by the workmen about half-past eight o'clock in the morning. It had taken place in the third storey. With the aid of a fire-hose attached to the *dépôt*, the workmen made a strong attempt to extinguish the flames, but the fire spread so rapidly amongst the dry fodder that their efforts were of no avail. A fire-alarm connected the stables with the southern fire station. This was rung, and detachments of the brigade from the central and southern stations were soon on the scene with a couple of engines. By the time firemaster Paterson and his men arrived the flames were shooting through the roof, and it was evident that the hay store could not be saved. The efforts of the firemen were, therefore, directed towards saving the machinery portion of the building. All the connecting doors in the partition wall were securely barred, save one or two at which firemen were stationed, and poured powerful jets of water on the burning mass at the other side. About half-past nine o'clock the roof fell in with a mighty crash, and the released flames flared up into the heavens. Fortunately what wind was blowing came from an easterly direction, and greatly aided the men in their endeavours to prevent the fire spreading eastwards. By ten o'clock the interior of the burning building had the appearance of a great oblong furnace. Only the great walls remained standing, and these showed wide cracks extending downwards to the third storey. The fire had almost spent itself by one o'clock, and most of the firemen were withdrawn, but a few were told off for the greater part of the day to pour water on the smoking ruins. The hay store was completely gutted, and the roof of the machinery building was also partially burned.

COMMERCIAL EDUCATION IN BELGIUM.*

IT is not so very long ago that, in England, there were only three classes of schools for the education of youth. The public schools, such as Eton, Harrow, Charterhouse, &c., for the sons of the upper classes; private proprietary schools for the boys of the middle class; and the parish schools—now called Board

schools—for the children of the lower classes. In the first of these Latin, Greek and mathematics formed the chief items of the curriculum. In the private schools many subjects were taught, but few were learned; and in the parish schools the acquisition of the three "r's"—reading, writing and arithmetic—were thought amply sufficient in regard to education for those who were destined either to work the loom, to build the house or to plough the field.

But, happily, we have changed all that, and in our day education is making such rapid strides that knowledge is within reach of all. In fact, some enlightened men are asking themselves whether or not we are going too far and too fast. This is a question I do not propose to discuss; it is not within my province. I simply wish to put before you to-day what is being done abroad in regard to commercial education, so that you may be able to judge whether or not, in this one respect, England is keeping pace with other countries.

England was once called a nation of shopkeepers; this was the stigma put upon our country by a great military commander; a bit of spleen emanating from the mouth of one who thought that glory to a nation was acquired only in the pursuit of arms. Of one who knew not that peace hath its victories as well as war; of one who ignored the ladder by which he himself had mounted to fame. It is, unhappily, even to-day the custom among a certain class to look down upon trade; and this contempt is never more loudly manifested than by those whose immediate ancestors have made their fortunes by trading. But, like Napoleon I., they forget that the prosperity of a country wholly depends upon its commerce, and that military glory can only be achieved by those whose one object in fighting is to protect the trading interests of their country. We see that Russia is thirsting for this military glory to-day; she is ready and perhaps anxious, to move her battalions across the frontier, but she cannot do so because she is poor; because her commercial and industrial activity has not kept pace with the thirst for territorial aggrandisement, and she is obliged to remain at peace simply because she is lacking in the sinews of war.

History shows us that the pursuit of commerce has ever been the mainstay of nations, and, without too much boasting, an Englishman may say that the glorious supremacy of Great Britain on land or on sea, throughout the world, is due to the fact that her commercial prosperity has enabled her to retain, by force of arms and length of purse, those vast territories which, in the first instance, have been obtained for her by

doughty pioneers who have gone forth to trade with the natives of far distant climes. Yes, we are proud of being a nation of shopkeepers, and hitherto we have been able to hold our own against all comers.

But—and there is a but in the case—signs are not wanting that Great Britain is no longer commanding foreign markets as she did only a few years back. Reports have been sent in by our Consuls abroad, showing that orders are now being sent to Germany, to Belgium and the United States that were wont to be exclusively forwarded to our great manufacturing centres; and the Board of Trade returns have lately shown that in many cases there has been a considerable falling off in our imports. Mr. Consul-General de Courcy-Perry, from Odessa, was one of the first to give the note of alarm. Mr. James Baker, in his little book entitled "Our Foreign Competitors," gave point to it by showing that Germany was cutting us out in many of our own fields of industry; and when at length Englishmen opened their eyes to the fact, the question was generally asked, "What must be done to keep the world's trade in English hands?"

Far-seeing men at once realised the truth of what Mr. de Courcy-Perry had proclaimed, viz that England was not being represented abroad by efficient commercial travellers, by men who could speak the language of the people among whom they travelled, and thus ascertain what was wanted on the market which their employers wished to serve. Other nations were represented by men who had the gift of tongues, and these booked all the orders. The Englishman worked hard with his interpreter always by his side, but he was never in touch with his customers, and at night his order-book was still empty.

Then came the cry for higher commercial education, and, thanks to such men as Colonel Howard Vincent in the House of Commons and Sir Albert Rollit at the London Chamber of Commerce, a forward movement was effected, and, as you know, much has already been done to give to lads destined for a commercial career an education which will fit them to compete successfully in that great commercial struggle which is now going on in all the markets of the world, and which will be more intense as the new nations further develop their industrial activity. As a proof of this, are we not told that Japan is already bidding for a part of the world's custom? The Japanese have shown themselves apt pupils of their European teachers in the art of war; they will likewise show themselves apt pupils in the arts of peace.

Established 1860.

It has always been said that the counting-house, warehouse or shop has been the fittest school for the lad destined for trade. This idea, at any rate, has obtained in England, and the boy of fourteen has been taken from his books to be placed in an office where, in copying letters and running errands, he has been supposed to pick up that training which fitted him ultimately to become a merchant or a manufacturer. Formerly, when international communication was very slow, many came out of the ordeal successfully, and it is not an uncommon thing to hear a prosperous business man boast that he had little or no schooling. This was very well in the old days, before the invention of the steam-engine, of the telegraph and of the telephone. But these inventions gave, with their rapid means of international communication, a fresh impetus to trade. It was found that new men were now required—men quick to discern, quick to decide, their decisions being based upon a thorough knowledge of the state of the world's markets. Such knowledge cannot be gained by those who stay at home within the narrow limits of an office, and whose mental powers have no other foundation than the limited amount of instruction they received at a proprietary school.

In France many years ago this fact was recognised by all thinking men, but it was reserved for Belgium, struggling to find work for her dense population, to be the first to give practical effect to the idea of establishing a special school for the commercial training of her young men. In 1851 our Prince Consort organised the first International Exhibition of All Nations in Hyde Park. His aim was to compare the progress made by the different nations in the industrial arts. The exhibition was a success, and it showed us—Englishmen—that we held the first place. But other nations profited by the lesson. They began to ask themselves if they too could not do something more than they had done in the past to promote their home and foreign trade, and Belgium saw that something could at once be done if she had but competent men to represent her in the foreign markets. Hence in 1852 some public-spirited men, under the leadership of M. Rogier, then Minister of the Interior, approached the Municipality of Antwerp and the Belgian Government with a view to the establishment of a commercial university. The idea was at once adopted; and before the year 1853 closed the "Institut Supérieur de Commerce," or Commercial University, was opened at Antwerp. It succeeded from the very outset, owing to the soundness of the principles on which it was established, and ultimately became the model upon which similar institutions were founded in France,

Switzerland, Germany, Italy, and even in distant Japan. In giving you this evening a sketch of what is being done in regard to commercial education in Belgium, I shall practically be telling you what is also being done in other countries abroad.

The first difficulty with the promoters of the scheme was the financial one, as in Belgium there were many people who still adhered to the old notion that a small amount of education sufficed for a man destined to be a trader. But the Government at that time was an enlightened one, and with the memory of Hyde Park still fresh in the minds of the Cabinet, it decided to share the expense with the City of Antwerp Corporation. The terms were at once agreed upon, and, as I said before, the classrooms were opened in 1853, and fifty-one students were at once enrolled. And from that day to this the Institute has steadily increased its usefulness, in proof of which we find that to-day its courses of lectures are frequented by young men from all parts of the world. It may be useful here to give some statistics on the steady increase in the "population" as the French say.

At the end of the first four years 316 students had been enrolled, of whom 226 were Belgians and ninety foreigners.

During the next four years 348 students, of whom 191 were foreigners.

At the end of 1867 there were 358 students, 194 being foreigners.

At the end of 1872, 571, 229 being foreigners; 1877, 666, 294; 1882, 637, 227; 1887, 683, 281; 1892, 945, 406; and when the next quaternary period shall have reached its term, we shall be able to report a still larger increase in the numbers.

It will doubtless be remarked that it is owing to the presence of foreigners that the numbers have so rapidly increased. This is a fact, but it must not be inferred that the appreciation of the Institute has declined in Belgium. This is easily shown when the figures are studied, for in the first quaternary period there were 226 Belgian students, whereas in the last, that ending in 1892, there were 539 students of Belgian nationality, that is to say, the numbers had trebled.

And this is not to be wondered at when we consider that, of the old students, there are at this day 249 who occupy the position of chief in the most important mercantile firms of the country; 218 who are bank managers or commission merchants of high standing; 5 are Belgian consuls-general; 4 are consuls; 5 vice-consuls; 8 others have served the country as acting consuls-general, and one old student is the Home Secretary for the Congo Independent State. In addition to which I may

mention that some old students have themselves become professors of commercial sciences in the establishments modelled in foreign countries on the same lines as the Antwerp Institute. This notably is the case at Odessa, Rheims in France, and at Tokio in Japan.

I have introduced these facts in order to show at the outset that the Institute has served the purpose for which it was founded, for it cannot be gainsaid that there are still many business men whose opinions are entitled to respect, who maintain that a school for higher commercial studies has no *raison d'être*. I venture to think that the success in life of the Antwerp students proves the contrary.

For the details of the curriculum I must refer you to the prospectus of the Institute. I will briefly state that the branches of study include all subjects a knowledge of which is indispensable to the merchant, banker, or trader, who wishes to succeed in life.

The students are divided into two classes—the "regular" and the "free." The former attend all the lectures with a view to obtain the diploma or degree at the end of the two years, which period constitutes the prescribed course of study. The "free" student is one who follows only the courses of lectures which he considers of paramount importance to him in his commercial career.

A regular student must pass an entrance examination, in which he must show a competent knowledge of two foreign languages, in book-keeping by single and double entry, in geography, history, natural philosophy, chemistry, geometry, arithmetic and algebra, commercial law and the elements of political economy. In short, the subjects generally demanded for matriculation at our own universities.

A free student need not present himself for this examination, as he is always free to cease attending the classes when once his particular object shall have been attained.

The course of instruction upon which the student enters, after passing his entrance examination, is practical as well as theoretical. The transactions of a large commercial house are simulated, the operations of a counting-house minutely practised, and all questions relating to the theory of exchanges are accurately described. The correspondence of the "office" must be conducted by the student himself, and that too in French, German and English, which languages are obligatory. He must also be competent to correspond in one other foreign language, the choice generally being either Spanish, Italian, or Dutch, a professor of each of these languages being on the

Institute staff. The principles of political economy, of international commercial law and customs' legislation are also inculcated; and special care is taken to make the students acquainted with foreign markets by furnishing them with reports sent in periodically by Belgian residents abroad.

In regard to a knowledge of all kinds of vegetable, mineral and animal produce, there is a well-furnished museum, with samples and patterns kept up to date, so that the professor is enabled to give to his pupils a practical knowledge of the article in which the latter will one day be called upon to trade. The geographical and economical condition of foreign countries is studied from carefully compiled data, and the relative value of raw material, from different sources of supply, is inquired into and noted.

The student is also encouraged to take a close interest in the political events of the day, so far as these affect commercial interests; and the latest consular reports from all countries are placed at his disposal, so that he himself, later on, may be in a position to make a report upon the commercial prospects of any country in which he may happen to find himself.

In the spring of each year the principal mines, factories, mills, &c., of Belgium are visited by the students, accompanied by one or more of the professors. In this way the young fellows acquire an insight into the actual working of those industrial establishments which have done so much to give to Belgium that measure of prosperity which she to-day enjoys.

Another important feature of the Antwerp Institute is the bestowal of travelling scholarships on the most deserving students. These are naturally limited to those of Belgian nationality. A sum of nearly 2,000*l.* per annum is devoted to this object. A student who has passed his final examination with credit is entitled to offer himself as a candidate for one of these scholarships, or "bourses" as they are called. If one be granted, he proceeds abroad, with the certainty of enjoying, for three years at least, an annual income of 200*l.* He is thus relieved of the necessity of accepting the first situation that is offered to him; and can devote the whole of his time, if necessary, to the study of the economic condition of the country in which he resides. He must send home periodically a detailed report of the results of his observations; by his previous education he is enabled to do this with a good result, and these reports, after being noted by the Government, are utilised by the students in the prosecution of their studies.

Down to the end of 1892, sixty-two students had been thus

sent abroad; the countries chosen for residence being Algeria, Morocco, the Cape, Japan, China, India, Canada, the United States, the Argentine Republic, Brazil, Colombia, Venezuela, Chili, Mexico, Cuba, Philippine Islands, Australia and New Zealand—in fact, those countries in which Belgium is seeking to place her manufactures. Of these sixty-two, twenty-seven have remained in the countries to which, as bursars, they proceeded, and are now doing exceedingly well as merchants or commercial agents; sixteen are established in European countries, also as merchants, and two have entered the service of the Japanese Government as teachers of the commercial sciences.

I have already said that other countries have followed Belgium in the steps she took to improve the higher commercial education of her youth, and at Paris a similar school has been established, which, though still in its infancy, is doing good work. It was not found practicable, however, to introduce into the French establishment such a high curriculum of studies, the result being that students, after studying for a year or so at Paris, come to Antwerp to finish their education. The same remark applies to the different schools in Switzerland, Germany, Italy and Roumania. Thus, as Antwerp took the initiative in introducing the system, the Institute has been looked upon as the model of such establishments, and its prestige is still undiminished.

To afford another proof that the promoters of the scheme really did supply a long-felt want, I may mention that in 1886, at Bordeaux, an international congress was opened, under the auspices of the French Government. The object was to discuss whether or not there did exist any necessity to establish "commercial schools," that is to say, establishments having a curriculum specially designed for the higher education of youth destined for a business career. This Congress was attended by many of the leading bankers, merchants and professors, not only of France, but of other countries; and after five days of close and careful deliberation, it was unanimously decided that to have followed such a curriculum as that pursued at the Institute at Antwerp was calculated most materially to aid a merchant in his career, and the French Government was requested to encourage the establishment of similar schools throughout the country. One leading merchant of a large French seaport rose in the Assembly and said that had he enjoyed the privilege of pursuing such a course of studies in his youth, he would have been saved at least five years of drudgery in the pursuit of that knowledge which has been so essential to his success.

The Institute of Commerce at Antwerp has also been the recipient of honours at the hands of juries at the following exhibitions, viz. Paris (1878), Brussels (1880), Antwerp (1885), Liverpool (1886), Melbourne (1888), Paris (1889), and Antwerp of last year.

It will now probably be asked what is the cost to parents of a higher commercial education, such as that given at the Institut Supérieur de Commerce at Antwerp. It is very small, the expenses of keeping up the establishment being borne by the Belgian Government in part, and the rest by the Antwerp municipality. But each student contributes, that is, pays a fee of about 10*l.* the first year and 12*l.* the second, the amount of which fees are paid to the professors as a supplement to their honoraria, thus following the custom of ancient Greece. This is called the "Minervale." The Government does its best to procure a really competent teaching staff, and pays so much a year to each "Chair," giving a pension to the professors after a certain number of years' service. There is also a fund to which the professors contribute a small sum yearly, for providing a pension for their widows and for their orphan children until they reach the age of eighteen years. The system works very well; the country has a fair return for its money by the extension given to its trade, and in allowing the professor to profit by the ever increasing number of the students, you give him every encouragement to keep himself *au courant*, and thus attract students to his chair.

As I have already stated, the study of languages is a strong feature of the Institute, and at the end of the two years' course there are very few of the young men who quit Antwerp without being thoroughly conversant with the languages most used in the world of trade. In fact, each student is more or less acquainted with three other languages, in addition to his mother tongue. I have known many cases where, say, a Roumanian has been able to write a commercial letter in French, German, English and Spanish. His own language has also enabled him to understand the same letter, if written in Italian, and his residence in Antwerp has given him a colloquial knowledge of Flemish, which to a very great extent is a provincial form of the Dutch language. In fact, the literary language of Flanders and Holland is almost identical.

It is this knowledge of foreign languages which in itself gives to the foreign trader a considerable advantage over his English competitor. It constitutes the most salient point, too, in comparing the attainments of a lad educated at home with those of one educated abroad. I am speaking of course only from a

commercial point of view. The average schoolboy in England has a smattering of Latin and Greek. He knows how to do all the rules of arithmetic, and he does them well. His geography and history are perhaps faultless. But abroad he finds boys able to calculate by the metric system without either pen or pencil, and if he attempts to show that he knows a little of the classics, nobody understands him, for the simple reason that his pronunciation of the words is a thing to be shuddered at by the ordinary well-educated foreigner. But in England the schoolboy, although he may spend four or five years in the study of the French and English grammar, is seldom or never taught to express himself correctly in either of these languages, much less in Spanish and in Italian, whereas, as I have already shown, a lad educated in a continental commercial school generally has four languages at his fingers' ends.

Then, again, the student at—say the Antwerp Institute—is constantly brought into close contact with his fellow students from Russia, Roumania, Brazil, Japan and China. He forms an acquaintance with these young men, picks up a word or two of their language, and ultimately the friendship of youth develops into the business relations of riper years. Besides, such acquaintances enable him to increase his knowledge of men and manners, of foreign countries and of customs, and this alone, when he is launched upon the world, enables him also to approach his fellow men with a certain amount of self-confidence; and in his turn to inspire in them the conviction, to use a homely expression, that his head is properly screwed upon his shoulders.

Thus I think I have shown that the aim on the Continent is education rather than mere instruction; and it is this superior education, enjoyed by the foreign commercial traveller, by the foreign merchant and by the manufacturer, which gives them the pull over their English rivals, and allows them to push their trade in markets inaccessible to the representatives of English firms.

I hope I have been able also to show that a commercial institute or university does offer tangible advantages to its pupils, and I venture to hope that the day is not far distant when a similar "school of commerce" will be established in London. In the meantime English parents might avail themselves of the advantages offered by one of the continental schools. The Institute at Antwerp is open to all, but, of course, a lad must be able to speak and understand French before being able to follow the courses of lectures, all given in French. But in each town there are good preparatory schools,

and in the spring of each year special classes are organised at the Institute itself in order to prepare candidates for the entrance or matriculation examination, which is held in October.

In conclusion I must state that seventeen is the minimum age at which it is considered advisable for a pupil to present himself for admission. The teaching is entirely that of a university, so that it is essential that the young fellow be of a sufficiently serious turn of mind to follow attentively the courses without being subjected to school-boy discipline.

I shall be most happy to give any further information to inquirers, and the fullest information may always be obtained on application to the courteous director of studies, Dr. Edm. Graudgainage.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

ART PLATES FROM "THE ARCHITECT."

Awarded Gold Medals, International Health Exhibition and Architectural and Building Trades Exhibition (1889).

PROOFS on PLATE PAPER of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing.

THE MARTYRDOM OF ST. STEPHEN. By E. J. POYNTER, R.A. Size, Forty Inches by Fifteen Inches. Price One Shilling Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

"AND THE SEA GAVE UP THE DEAD." By Sir FREDERIC LEIGHTON, President of the Royal Academy. A few Proofs of this Fine Art Plate can be obtained (if ordered at once), price Two Shillings each. Free by post, carefully packed inside patent roller Two Shillings and Two Pence.

THE BANQUET. The well-known and beautiful Chromo-Lithograph by H. STACY MARKS, R.A. Size, Thirty-nine Inches by Fifteen Inches. Price One Shilling. Free by post, carefully packed inside patent roller, One Shilling and Three Pence.

1. AN OFFERING TO CERES. 2. THE EDUCATION OF BACCHUS. 3. MINERVA VISITING THE MUSES. 4. JUDGMENT OF MIDAS. By W. HAMILTON. Size of each plate, Forty Inches by Fifteen Inches. The whole forming a very beautiful Frieze in Bartolozzi Mezzotint. Price per set, Six Shillings on Proof Plate. Free by post, carefully packed inside patent roller, Six Shillings and Six Pence.

THE HISTORY OF JOAN OF ARC. By M. JULES EUGENE LENEPVEU. From the Wall Painting in the Panthéon, Paris. Four Pictures on one Plate. 1. Domremi: Inspiration. 2. Orleans: Struggle. 3. Reims: Triumph. 4. Rouen: Martyrdom. Size, Forty Inches by Fifteen Inches, on Proof Plate. Price, Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Six Pence.

THE WATERLOO HEROES. By J. P. KNIGHT, R.A. Dedicated, by Special Permission, to VISCOUNT WOLSELEY, K.P., G.C.B. Proofs, price One Shilling each (thin Plate Paper). Proofs (Special), price Two Shillings and Six Pence each (thick Plate Paper). Size Twenty Inches by Thirty-six Inches. Framed and Glazed in Oak, Complete, One Inch, Twelve Shillings each. Ditto, One and a Quarter Inch, Fourteen Shillings each. Ditto, One and a Half Inch, Seventeen Shillings each.

THE TOILERS OF THE DEEP. Two Tinted Ink Photographs. Size, Eighteen and a Half Inches by Thirteen and a Half Inches. Price Two Shillings. Free by post, carefully packed inside patent roller, Two Shillings and Three Pence.

JOHN SELL COTMAN'S PICTURES, lately on Exhibition at the Burlington Fine Arts Club. The Plates are uniform in size, Twenty-one Inches by Fifteen Inches. The Titles are as follows:—1. Rouen from Mount St. Catherine. 2. Breaking the Clod. 3. View in North Wales. 4. Norman Arches. 5. Byland Abbey. 6. Norwich, from the Cromer Road. 7. Dewy Eve. 8. Mousehold Heath. 9. Cader Idris. 10. Castle Eden Dean, Durham. 11. Bamborough Castle. 12. The Interior of Norwich Cathedral. 13. Mountain Pass in the Tyrol. 14. Postwick Grove.

The price of the Set is Twelve Shillings and Six Pence; by post, carefully packed in patent roller, Thirteen Shillings. Kindly order early, as only a limited number of proof copies can be obtained.

May be obtained from all Newsagents, Booksellers, Messrs. W. H. SMITH & SON'S Bookstalls, or from the Publisher, P. A. GILBERT WOOD, 175 Strand, London, W.C.

THE Architect and Contract Reporter.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

* * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 P.M. on Thursdays.

TRADE NOTES.

THE efficient and economical lighting of barracks and officers' quarters is a question of pressing necessity in places remote from gasworks or electric light stations. In many cases lamps are used, and prove a constant source of trouble and anxiety as to possible explosions with disastrous fires to follow. We have had brought to our notice an excellent, perfectly automatic gas-making machine for buildings and places having no gasworks. It is called Müller's Alpha Patent, and is an improved form of the machine made by Messrs. Müller & Atkins, 22 Mary Ann Street, Birmingham. It has been before the public for many years, and seen the rise and fall of several competitors. Many thousands are now in use for lighting every description of building in this country, the Colonies, India, &c. The gas produced is a pure article. Unlike coal gas, it does not give off sulphurous fumes, and will not injure delicate decorations or destroy plants and pictures. It is useful for lighting, cooking, heating and power, just as coal gas is. The apparatus requires no skilled labour, is complete in itself, has no unsightly chimney, requires no fire, makes no ashes or smoke, and causes no dirt. It is equally suitable for a mansion, officers' quarters, barrack rooms, or small private dwellings, the burners and other fittings being as cheap, or as luxuriously designed, as may be desired. The whole machine is easily packed for export. It proves a boon wherever introduced, and is economical in use.

We are informed that the Edison and Swan Company are about to ascertain in a court of law whether they can enforce satisfactorily the following clause in the agreement under which they allow licensees to work certain of their patents:—"The licensee shall not make or allow any discount, commission, return, gift or allowance to customers greater than the discount from time to time allowed by the company." It is alleged that this clause has been disregarded, especially as concerns lamp-holders, by certain licensees, to the detriment of others, and the proceedings referred to have been instituted chiefly for the protection of the latter. It is an evidence of the close competition between electrical engineers and manufacturers that such a course as this has been considered necessary.

MESSRS. RUTTY write us as follows:—"We have the pleasure of informing you that we are carrying on business as paviors, masons and general contractors, of which trades our late father, Geo. G. Rutty, had been for over forty years honourably connected, with whom for many years we have personally co-operated. We have invented a "New Macadam

Road Scarifier," which will enable us to perform with greater expedition such contracts necessitating its use; and further point out that our invention contains many improvements on the original pattern, and much superior to any machine now in use. We are prepared to undertake contracts for steam-rolling, hauling boilers and heavy weights, of which we have personally made a speciality for many years past. At our shoot at Hackney Wick we are able to receive any quantity of excavated material.

AN excellent result followed the trial just made at Bromley of a newly-invented road scarifier, which, judging by the results, bids fair to eclipse any of these machines that are now in use. The "Duplex" scarifier (as it is called) is very simple, and weighs considerably less than any of its predecessors, while the cost is little more than half. It is worked by any ordinary 8 or 10 ton steam roller, and one of the advantages is that the roller can push the machine as easily as drawing it, and this without detaching. The teeth (or tines) are arranged in a very ingenious manner, by which the crown of the road is broken up with a minimum expenditure of power. The inventors are Messrs. A. & H. Rutty (sons of the late well-known contractor of that name), who are carrying on business at Bromley-by-Bow. Having had exceptional opportunities of the practical working of road scarifiers since they were first introduced, the inventors have embodied in this machine the maximum of simplicity and all the latest improvements.

MESSRS. PECKETT & SONS, of the Atlas Engine Works, Bristol, have just issued a copy of their new illustrated lists of tank locomotive engines they have in stock ready for immediate delivery. The locomotives described are all of their latest designs, well proportioned, and equally balanced. The principles of motive power are correctly applied, the construction is as simple as possible, and there are no intricate working parts to get out of order. They are built of the very best material by the best workmen. Every engine passes the most rigid inspection on completion, and they are thoroughly tested on rails before leaving the works, and no engine is sent out unless fully up to the standard.

MESSRS. WILLIAM FISHER & SON, of 53 Paradise Street, have just been appointed makers to the Birmingham School Board for three years, and are now furnishing latest new schools for Wolverhampton and Handsworth (Staffs) School Boards, each school for over 1,000 children, the furniture being all of oak.

THE construction of two new service reservoirs in connection with the Leeds water supply is proposed. The cost of the land is expected to amount to about 3,600*l*.

It is proposed to lay out 3,850*l*. on improving the water supply of Masham.

THE Dunoon Police Commissioners have concluded an arrangement with the Hafton trustees whereby they acquire the pier, pier-master's house, skating-rink, restaurant, stables and the ground between the pier and the Barren Rocks for 27,000*l*.

THE *Glasgow Herald* says in regard of the Deer Forest Commission, "We understand that the plans and specifications for alterations and improvements (to the extent of 5,000*l*.) to have been carried out on the estate of Glencastley, Sutherland-shire, by the proprietor, Mr. W. E. Gilmour, Woodbank, Dumbartonshire, have now been entirely withdrawn. The architects employed were Messrs. Alexander Maitland & Sons, Tain, Ross-shire, and John Burnet, Son & Campbell, Glasgow. This step has been taken by Mr. Gilmour on account of this Commission having scheduled two-thirds of the best land on the estate for small holders, thereby breaking up his large sheep farm, of which he is sole tenant.

THE new bridge over the Clyde joining Glasgow to Rutherglen was inaugurated on Wednesday by the laying of the memorial-stone. The new bridge, which replaces an older structure erected as far back as 1775, is a handsome granite bridge of three arches, the centre one of which has a span of 100 feet, each side arch having a span of 90 feet.

AT the Coatbridge Dean of Guild Court plans have been passed for the erection of new properties, the estimated value of which is upwards of 10,000*l*.

PLANS are to be prepared for the extension of the Henley Board Schools.

THE *Leeds Mercury* says:—The remarkable effects of the severe frost of last winter are set forth in the report just prepared by the water committee of the Sheffield Corporation. It states that 20,000 houses were deprived of water, that the number of streets affected was 212, the number of metal service-pipes fractured 8,614, and that cast-iron pipes repaired or relaid amount to an aggregate length of 14½ miles. The cost of affording temporary supplies and the special repairs was up to March 1, 1894, and a further expenditure of 7,317*l*. was incurred between that month and May 25. The work of relaying and lowering pipes is still being carried on, and even at the present time 170 additional men are employed remedying the defects caused by the frost, and involving further charges on the current year's revenue. In the middle of May no less than 535 pipe layers were at work, and many thousands of lead communication pipes burst between the mains and the houses.

The other day a party of members of the Society of Engineers were able to visit the works of the Waterloo and City Railway which is to be worked by electricity. When opened it will enable passengers to get from Waterloo to a point near the Mansion House without stoppages in about four minutes. The departure platform of the Electric Railway at Waterloo will be about 36 feet below the South-Western platforms, while in the City the depth below the surface will be 65 feet. At the latter place lifts will be required, but at Waterloo it is proposed to have easy inclines, with a few stairs at intervals. The line commences at Waterloo at right angles to the existing lines, passes under Stamford Street until Hatfield Street is reached, where it bends to the left, and passing under some property at a depth of 56 feet reaches the Surrey side of the river at a point some 500 feet on the up-stream side of Blackfriars Bridge. The river is crossed obliquely, the centre line on the Middlesex side being about 120 feet on the up-stream side of Blackfriars Bridge. From this point the railway bends to the right, and then passes along the centre of Queen Victoria Street to its terminus in the City, opposite the Mansion House. The total length of the line will be, in round figures, 1½ mile.

It will cover on Brick, Plaster, Stone, Cement, Wood, Iron, and Metals of all descriptions.

A HIGH-CLASS PAINT FOR DECORATIVE ART WORK.

REQUIRES NO SIZING, IS WASHABLE, VARNISHABLE, IMPERISHABLE.

WILL KEEP ANY LENGTH OF TIME.

Works very FREELY and covers EVENLY. It only requires thinning with TEPID WATER. Its covering properties are nearly half as much more than any other Paints or Distempers.

ANTHYDOR COMPOUND & GENERAL PAINT CO.

LIMITED,

47 VICTORIA STREET, WESTMINSTER, S.W.

THE contract for reseating the Leeds Town Hall has been given to Mr. James Jackson, of St. Ann Street, Leeds.

THE Leeds Town Council have decided that the police-station at Wortley must be rebuilt.

ELECTRICAL.

THE *Leeds Mercury* says:—The Yorkshire House-to-House Electricity Company, Limited, are about to further reduce their price for electricity. The new scale of charges comes into operation on July 1, when the maximum gross price will be 6d. per unit. This is reduced to 5½d. per unit in the case of consumers of not less than 1,500 units per quarter, and to 5¼d. per unit when the consumption for the quarter exceeds 3,000 units. A scale of discounts is also announced, the benefits of which are available equally to the smallest and largest consumers, the discounts being calculated upon the consumption per lamp. A consumer using his lamps not less than 300 hours in the quarter is entitled to a discount of 5 per cent., and for a greater number of hours' use the discount increases up to a maximum of 15 per cent. An additional discount of 5 per cent. is allowed in all cases for prompt payment. Under the new scale the minimum net price is slightly under 4½d. per unit, whilst the greatest price payable by any consumer is just under 5¾d. per unit. Leeds will thus have the benefit of one of the cheapest supplies of electric light in the country. For heating, cooking, and motive power the company are supplying current at 3d. per unit. The use of electricity for these purposes is steadily extending. The number of lamps now connected to the mains is about 28,000, compared with 11,500 a year ago.

THE recommendation of the committee has been adopted by the Edinburgh Town Council, to make an extension of the high-tension electric mains at an estimated cost of 5,000l.

DUNDEE INSTITUTE OF ARCHITECTURE.

THE annual excursion of the members of the Dundee Institute of Architecture, Science and Art took place on Saturday—Colliston Castle, Letham Grange and St. Vigeans Church being the places chosen for visitation. The party, numbering about thirty, and including several ladies, left the East Station, Dundee, at 12.30 P.M. On arriving at Arbroath they were

joined by Mr. A. A. Symon, architect, Arbroath, who acted as guide for the rest of the day. Leaving Arbroath at 1.30, the excursionists arrived at Colliston Station a quarter of an hour later and walked to Colliston Castle.

At the castle they were met and cordially welcomed by Mr. and Mrs. Peebles Chaplin. The recent alterations and improvements on the building were explained at length by Mr. Chaplin, who also gave a lucid and most interesting account of the history of the castle. In this connection he took occasion to correct an error made by Messrs. M'Gibbon and Ross in their work on the castellated and domestic architecture of Scotland, who give the date of the castle as 1553, and thus held that it could not, as tradition asserts, have been built by Cardinal Beaton. Mr. Chaplin quoted from an ancient Latin charter signed by the monks of Arbroath Abbey, showing that "the principal mansion-house of Colyston" was in existence in 1545. The attention of the visitors was specially directed to several ancient stones now built into the walls of the castle, these having been recently recovered by Mr. Chaplin during building operations. It is conjectured that the stones had at one time been taken from an ancient religious temple, which is known to have existed in very early times in the vicinity of Colliston. Other interesting features were pointed out, and the party were subsequently shown over the interior of the mansion. Great admiration was expressed at the fine artistic taste shown in the fitting-up and furnishing of the various principal apartments. The excursionists then walked to Letham Grange House, permission to visit which had been given by Mr. Fitzroy C. Fletcher, the proprietor. The charming situation of the mansion was noted, and the architectural features of this fine building were greatly admired. Subsequently the visitors were, by the kindness of Mr. Fletcher, permitted to inspect the interior of the house. The many and costly articles of *vertu* within the walls were shown the visitors, special notice being taken of Pettie's famous picture, *The Chieftain's Candlesticks*, an example of Turner, and Colin Hunter's well-known *Fisher Girl*. The visitors were particularly struck with the elaborate arrangements made for lighting the house by means of the electric light, with the fine music provided by a military band organ on the principal staircase, and with the luxuriant vegetation in the conservatories. The visitors were subsequently shown over the stables and riding school by Mr. Letts, and next paid a visit to the extensive greenhouses, over which they were shown by Mr. Duncan, head gardener. Returning by train to Arbroath, the excursionists

THE "E. R. A." PHOTO BLOCK COMPANY,

City Office:—4 & 5 East Harding Street, Fetter Lane, E.C.

Half-Tone Blocks prepared from Water Colour or Pencil Drawings or Photographs, to print with type, on an entirely new Method, by which the Cross-bar grain is dispensed with, giving greater brilliancy to the picture, and more definition of detail.

 For Particulars and Specimens apply to ALFRED FISH, Manager.

partook of tea in the White Hart Hotel, after which they drove to St. Vigeans Church. Here they were met by the Rev. Dr. Duke, and conducted over the building. The famous Drosten Cross (one of the stones scheduled for preservation by Act of Parliament) and the various other ancient sculptured stones were inspected with peculiar interest, Dr. Duke's exposition of the historical antecedents of the stones and of the church being much appreciated. Having been shown over the beautiful grounds attached to the manse, the party were invited inside to partake of refreshments. Dr. Duke expressed the pleasure it always afforded him to welcome parties interested in St. Vigeans and its church, one of the oldest religious settlements in Scotland. The party then drove back to Arbroath, and returned to Dundee in the evening. The excursion, arrangements for which were made by Mr. J. J. Henderson, secretary of the institute, was of a most successful and enjoyable nature.

HULL LIBRARY.

THE Northern Branch Public Library was opened on the 13th inst. by Sir James Reckitt, Bart., deputy chairman of the Hull Public Libraries Committee. It is situated on the Beverley Road, at the corner of St. Hilda Street, with a frontage in both thoroughfares. The building is faced with red pressed bricks, relieved with Ancaster stone dressings. The roof is broken by turrets and gables. It is covered with green slates, the gables with moulded stone water-tabling, finishing at the top with carved open stones. The arches have their tympana filled with stone carving. In the large windows of the reading-room two dragons are upholding a shield, with the Hull coat-of-arms in bold relief. The window over the porch door is filled with foliage, with a shield in the centre. At each side of the porch door are heads, designed to represent knowledge and strength—"Knowledge is power." The tower in the centre forms the roof of the staircase, and is surrounded by a battlement, with carved gargoyles.

The entrance is in the centre of the Beverley Road front through a gabled porch and two swing-doors filled with stained glass. These open into the front hall (25 feet by 10 feet) with a marble mosaic floor, and facing the visitor is the counter space for the lending library, extending over the full length of the hall. Overhead is a panelled ceiling, the central feature here again being a shield in plaster cast work. The hall is well

lighted, and those borrowers having to use the indicators will find abundant light night or day. To the left, immediately adjoining, is the reading-room (32 feet wide and 42 feet 6 inches long) with curved ceiling panelled to half the height of the roof, on the hammer-beam principle. This room is lighted by four large windows, the upper lights of each being filled with stained glass in lead lights. The room is heated by radiators on the low-pressure system, which is carried throughout the entire building. The fittings of the reading-room are of walnut, and embrace the reading-desks, which stand across each end, whilst space is afforded for sixteen reading tables. Opening from a door to the right is the lending library (24 feet by 33 feet), where ample room for book storage is to be found. This room is lighted from the roof, and commands a full view of reading-room, windows connecting both rooms. The fittings are of walnut, with accommodation for over 10,000 books, which at any future date can be extended. The library contains about 8,500 volumes. To the right of the entrance hall is the back hall, leading to the officials' rooms and the staircase, which leads to the committee-room, &c. The committee-room extends over the entire hall, and has a curved and panelled ceiling. The work has been carried out by the architect, Mr. Henry Cheers, Twickenham; the builders are Messrs. Bowman & Sons; the painter, Mr. W. Beautiment; the plumber, Mr. W. Finch; the hot-water engineer, Mr. Holdroyd, Leeds; the internal fittings are by Mr. Lacenby, from plans by the Corporation architect; and the incandescent light by Messrs. Hare & Co. The total cost is slightly under the estimate of 2,000l.

RAILWAY RELICS.

IN searching for particulars for his "History of the London and South-Western Railway," Mr. G. A. Sekon (the author of "A History of the Great Western Railway," and other books on railway subjects) has come across some of the very first specimens of vehicles constructed to run on railways, viz.:—two open passenger carriages, each about 9 feet long and 6 feet wide, running on four cast-iron wheels; each carriage weighs about two tons. Besides the carriages there is a goods' wagon of an equally primitive type. The vehicles were built in 1834 by the Bodmin and Wadebridge Railway Company, which line, "in spite of all temptations to become broad gauge," refused, and for sixty years remained the narrow-gauge sentinel in Cornwall of the L. & S. W. R.

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of her admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM, by HENRY BEYAERT, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work will be published in twenty to twenty-five parts, consisting of ten folio plates each, appearing quarterly. Thirteen parts are already out. Subscriptions are received for the entire work only. Price per part, 12s.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The third year of the New Series (1893) is in preparation, and will form the eighteenth year of the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

E. LYON-CLAESEN, ART PUBLISHER, BRUSSELS (BELGIUM).

On June 1, 1895, the L. & S. W. R. Company completed their narrow-gauge North Cornwall line to Wadebridge, and so became physically connected with their ancient Cornish possession, the Bodmin and Wadebridge Railway.

These old specimens of rolling-stock had long since been disused and thrown on one side, although fifty years back they used to run on Mondays, Tuesdays, Wednesdays and Fridays from Wadebridge to Bodmin, returning on Thursdays and Saturdays. These interesting types of old railway vehicles have been cautiously removed to the Eastleigh Carriage Works, where they will be carefully preserved until such time as England possesses a National Railway Museum in which can be deposited the valuable relics of early railway machinery, instead of being kept as at present hidden away in the works of the various railway companies, and therefore inaccessible to the ordinary student of railway progress.

Such a museum Mr. Sekon hopes will some day be established as a national monument to the skill and talent of those illustrious Englishmen who invented railways, which have done more than anything else to develop and civilise the world.

BUILDERS AND BOUNDARY WALLS.

In the Torquay County Court Mr. Edmund Pike, builder, brought an action against Mr. William Brendon, another builder, to recover 10*l.* for damage alleged to have been done to plaintiff's boundary wall by defendant's excavations. At Ellacombe plaintiff built a couple of houses with an ordinary 4-feet 6-inch boundary wall, the foundations of which were about 15 inches deep. Defendant subsequently took a plot of ground adjoining, and in excavating undermined plaintiff's boundary wall in some places, so much so that a portion of the wall fell. Mr. E. Pike said the cost of rebuilding the wall was 8*l.* 1*s.*, and other damages brought the total claim to 10*l.* The wall was built in 1888, and was solidly constructed.

Mr. J. Mountstephen said the wall fell because the ground was excavated. The wall was well built.

The Judge said the depth of the foundations depended on the soil.

Mr. Mountstephen: You are quite right, your lordship.

His Honour: You see Mr. Mountstephen confirms me.

Mr. William Tucker, who built the wall, said the foundations were well laid, about 15 inches deep. He also assisted in rebuilding the wall.

Mr. J. Pike gave similar evidence.

Mr. Eastley held that all he (defendant) was called on to do was to leave a sufficient foundation to keep the wall up, and he should prove that there was sufficient foundation and a good resistance bank of the best material. There need have been no resistance bank if the wall had been properly built. He maintained that it was owing to bad construction that the wall fell.

Mr. Brendon said that some of the mortar used in the construction of the wall was made of mud. The wall was not tied as it should have been. He estimated that the cost of rebuilding the wall was 6*l.*

Cross-examined: The wall stood for seven years before it fell. The wind had something to do with its fall.

Mr. Goss, a surveyor, agreed.

Mr. Yeo, builder, said he examined the wall for defendant. He did not know why the wall fell, and declined to have anything to do with the case.

Mr. Richards, Manor Office architect, said there was not sufficient foundation to the wall. It would have fallen in any case. Mr. Pike acknowledged that he (the architect) had often complained of his work.

Mr. Pike: I don't acknowledge it.

A mason in Brendon's employment supported defendant's case.

His Honour, giving judgment, did not think the wall went down to the shale, or that its fall was caused by defendant. Verdict for defendant with costs.

ELECTRICITY AND GAS.

At the meeting of the Incorporated Gas Institute in Edinburgh a paper by Mr. F. H. Medhurst, on the subject of "Electricity Supply from Town Gas," was read. He submitted for the consideration of the institute a few important questions in connection with the supply of electricity from central generating stations for public and private purposes. It would probably be freely admitted by every member of the society that the electric light had come to stay, and that in every town of even average importance there was a fair and increasing number of persons desirous of having their business or private premises electrically illuminated, even though the cost in the great majority of cases were greater, light for light and time for time, of the electric than the gas light. It was no longer necessary

to urge the numerous and unique advantages of electric light, because they were now almost as freely recognised by gas engineers as by electricians. There could be little or no doubt that the number of electricity supply works in existence and in immediate contemplation would be greater than was actually the case but for the strenuous opposition which the electric lighting industry had from the commencement sustained from almost all those interested in the maintenance and development of the gas industry. But he thought that a very little calm consideration must show that to maintain that because hitherto the consumption of gas has not been seriously affected by the use of electricity, therefore it never would be prejudicially affected, was to display ignorance or disingenuousness. Electrical engineers recognised that the cheapening of the electric current produced at central stations depended, in a very great measure, on the extent to which electricity came to be used during the daytime, and generally during the time when the generating plant was not required for lighting purposes, and it was certain that if the plant at generating stations could be worked at full load, and without the intervention of electric accumulators, for twenty hours out of the twenty-four, then the electricity produced could be very profitably sold for considerably less than 3d. per unit. But if this thing came to pass—as, rightly or wrongly, he was convinced it would—what would be the effect on the gas undertakings? If the electricity were produced—as was now usually the case—through the intervention of steam-boilers and steam-engines, then he made bold to say the result would be to very seriously cripple at least a great number of the gas undertakings in this country. With the single exception of the Corporation of Belfast, no local authority appeared to have recognised that there was no great advantage to be derived from founding one kind of lucrative business if that business was to proportionately reduce the profits of an existing and a paying undertaking already in the possession of the ratepayers. In his opinion, there was one way, and one way only, whereby electricity supply works could be so carried on as to permanently benefit, from a commercial standpoint, the gas undertaking. Obviously this was a consummation devoutly to be desired—at least in those cases where the gas and electricity supply businesses were in the possession of the local authority, or where (if there were such an example) both belonged to the same company. In his opinion, the problem was only to be solved on a permanent and sound financial basis by the employment of gas-engines, actuated by town gas, to drive the dynamos. If the two under-

takings were worked so as to be interdependent, they must necessarily exercise a beneficial influence on each other's paying capacities. An increase in the demand for electricity would necessitate the manufacture of a proportionately greater quantity of gas. There would be a series of actions and reactions; and there would be no rivalry between the businesses of gas and electricity supply, because there would be no clashing of interests.

Mr. Ellery remarked that the suggestion of using gas for producing electricity was actually an accomplished fact, although not in the way Mr. Medhurst had suggested; and it was important for them to keep before them whether the arrangement was to be conducted by gas-driven engines at central stations or by the same process on the premises illuminated.

Mr. West ridiculed the idea of the electric light ever being supplied at the cost suggested by Mr. Medhurst. He argued in favour of the gaslight as against the electric light, and said he thought they had shown that, instead of the electric light injuriously affecting them, they were still making the distance greater between the two.

Alderman Myles observed that no doubt electricity had come to stay, but he was not afraid that the supply of electricity, given either by private companies or public corporations, would in the long run materially affect the supply of gas.

Mr. Carr said he thought they must agree that not only had the electric light come to stay, but that it must be accorded the first place in point of quality as an illuminant. At the same time he contended that gas was as capable of development as electricity, and that the latter would not reduce the consumption of gas any more than gas had been successful in reducing the consumption of candles and oil.

THE BALTIC SEA CANAL.

THE special correspondent of the *Standard* in the course of an article on the new canal says:—

The canal is 98·65 kilometres long. It starts at Brunsbüttel on the lower Elbe, intersects a lake called the Kuden-See, follows the course of the rivulet Holsten-Au past Burg to Grünthal, 30 kilometres from Brunsbüttel, where it is spanned by a high-level bridge for the Neumünster-Heide Railway and a high road. As far as Rendsburg it traverses a monotonous

and swampy country, dotted with melancholy fir woods at rare intervals. Beyond Rendsburg it passes into the Eider, and the scenery becomes more picturesque. Passing through the Andorf Lake, the Borgstedt Defile, and the Schirnau Lake, it passes Levensau, where there is a second high-level bridge, and enters the Baltic at Holtenau, on the western shore of Kiel Harbour. The main channel is 9 mètres deep and 22 broad. The total width of the canal is fully 60 mètres. Steamers can use their own steam, but sailing ships must be towed, twelve steam tugs being provided. The canal is wide enough for two ships to pass at all points of its course; not only two of the largest merchant steamers, but even a large warship and a merchant steamer can pass each other without danger of collision. There are also six special sidings, as in the Suez Canal, so that even the largest ironclads can pass each other. All possible care has been taken to minimise the number of curves, and to make the radii as wide as possible.

Four railways cross the canal, two by swing bridges and two on high-level bridges. They do not obstruct navigation in the least, for they leave the whole breadth of the canal free, and there is a clear space of 42 mètres between them and the water. At night the canal is lighted by electric lamps, placed at intervals of 150 mètres, and at still shorter intervals at the curves. In the lakes gas buoys are laid. The double locks at Holtenau and Brunsbüttel are of great size. Their available length between the gates is 150 mètres, their width 25, and their depth 9.8. The largest German ironclads are 112 mètres long and 19½ wide, and have a draught of 8½ mètres. Except the new lock at Bromerhaven, these are by far the largest locks in the world. The gates are moved by hydraulic power. The Brunsbüttel lock remains closed during the flow of the tide, and is opened only when the water is at the same level on both sides of it. The entrance is on the right; the exit on the left. The Holtenau lock is always open except in stormy weather.

The cutting of the canal was, on the whole, not very difficult. Except in short stretches of moor, especially in the middle, the soil that had to be taken out generally consisted of sand and clay, and at times the task was a toilsome one, owing to the slips of sand and clay that followed the operation, and the occasionally copious flow from underground watercourses. Save for a number of irregularly scattered blocks of granite, the getting out and blasting of which was a very laborious business, no solid rock was found. The hopes of geologists that the cutting would give them an accurate knowledge of the

primeval mountains of Schleswig-Holstein, or enable them to make other important observations, have consequently been almost wholly disappointed. But there were some exceptions. In the moors of Grünthal and Beldorf interesting fossils of plants of the diluvial period were found, and the views expressed by Haas many years ago regarding the importance of the second glacial period in the formation of Schleswig-Holstein have been completely confirmed. The almost total absence of rock enabled the engineers to make the most extensive use of machinery. Seventy dredgers, ninety locomotives, fifty-nine steam-engines, 133 steam-tugs and 2,473 transport-wagons were at the disposal of the building committee, which consisted of about 300 members. The maximum number of labourers employed at one time was 9,000, but, on the average, about 6,000 were employed in summer and 3,000 in winter. For their accommodation the Imperial Canal Commission built a number of barracks, which proved admirably well suited for the purpose. The dormitories, each intended for eight men, were 9 mètres broad, 4 long, and 4 high. They contained for each man an iron bedstead, a seaweed mattress, wedge-shaped bolster, sheets, one blanket in summer and two in winter, a towel, a locker, and a stool. Each workman had to pay 60 pfennigs (7d.) a day for coffee in the morning, dinner, washing, lodging, light, and fuel. Dinner consisted of about two litres of strong nourishing food. Breakfast and supper the men could buy at the canteen; the prices fixed by the Canal Commission were extremely low, and were posted up at suitable places in the barracks. The average working time was ten hours a day. Wages were paid fortnightly, and, to prevent the development of the truck system, the payment of wages by middlemen was strictly forbidden. The average wage was 3½ marks (3s. 6d.) a day, but some skilled labourers earned considerably more.

The first impression of the canal at Brunsbüttel is rather disappointing, since at that spot its great breadth is not fully appreciated. Brunsbüttel, the home of the pirates of the thirteenth and fourteenth centuries who harried the Hamburg traders, is now, after a sleep of five hundred years, once more awakened to life, to become the western terminus of the canal, though in reality it lies some distance to the north of the actual mouth. It will, however, soon be connected with Brunsbüttel-hafen by rows of streets, and with the real mouth "Kaiserhafen," where it is proposed to build an entirely new town of 10,000 inhabitants. On closer examination it is impossible not to be impressed by the two enormous locks (one for incoming

and one for outgoing vessels) forming one end of the outer basin, with their granite piers looking as if they were constructed to last for ever, and by the wide outer basin, with its two great lighthouses, the lights of which (the western red, the eastern green) are about 53 feet above the level of the water. In order to prevent incoming vessels colliding with the piers, the axis of the outer basin is placed at an angle of 45 degrees, so that a ship can enter it almost straight either with or against the current. The western mole is 267 mètres, the eastern 131½ long; yet, according to seamen, the latter is still too short. In front of the moles is a roadstead 1,500 mètres wide, and about 12 mètres deep, distant 16 knots from Cuxhaven, 12 from Glückstadt, 40 from Hamburg, and 27 from Brunshausen, on the opposite back of the Elbe, near Stade. The outer basin is 100 mètres wide, and is enclosed by a stone wall protected against the impact of ships by great bollards, and standing 3·23 mètres above the normal water level. The western side of the basin is 450 mètres long; the eastern side 340, of which 350 and 240 mètres respectively will be utilised for fastening up ships. There is also here a small basin for pilot boats and pilot steamers. The outer basin is intended simply to be a place of waiting for vessels wishing to pass through the locks. The depth at average low water is from 11 to 13 mètres. It is, therefore, navigable for the largest ironclads at low tide; and, what is of particular importance, has remained unchanged for more than a century. The canal at the mean water level has a depth of 9 mètres, and about half a metre more or less at flood or ebb tide.

From Rendsburg to Holtenau the canal bed is level; from Rendsburg to Brunsbüttel it falls with a slight gradient. The breadth at mean water level is 67 mètres. The course for 63 per cent. of the total length of 98·6 kilomètres is straight, while the sharpest curves have a radius of 1,000 mètres; they occur at Levensau, and constitute 3·3 per cent. of the total length. The height of the water in the locks in the Elbe and in the canal is shown by an automatic gauge set up on the land to the westward of the locks in a tower 16 mètres high. The indicating plates are lighted at night by electricity. An alarm-bell announces the setting-in of ebb or flood, the closing of the gates and the moment when the outer and inner waters are at the same level. The inner basin at the northern end of the locks serves as an anchorage and unloading place. It is more than 500 mètres long and 200 wide, and, therefore, considerably larger than the outer basin. A quay-wall, strongly built of stone, rising 1½ metre above the normal water level, surrounds it.

It is protected by bollards rising to the height of 7½ mètres above the water level, and by floating rafts. On the east side landing stages have been constructed, and on the west side there is a basin for the boats belonging to the Canal Administration and to the canal pilots. Near the locks for incoming vessels on the outer basin are the offices of the harbour officer, protected from the water by yet another embankment. On the west side of the locks is the building to be used by the Elbe pilots, with sixty beds, and close to it the Custom House. On the east side of the inner basin are the boiler-houses and engine-houses, which supply the power for working the sluices. The arrangement is exactly the same as at Holtenau. The water for feeding the boilers comes from the Kuden-See, distant about six kilomètres. The Brunsbüttel basin is connected by a railway 6·8 kilomètres long with the St. Margarethen station of the Marsch-Bahn, running from Elmshorn to the Danish frontier. The traffic along the high road from Itzehoe to Brunsbüttel, which has been interrupted by the canal, is now taken over by a ferry at the end of the inner basin. As on all ferry-boats, no fare is charged, as the Government has undertaken to work it at its own cost.

EDINBURGH WATER SUPPLY.

THE *Scotsman* gives a report of the meeting of the Edinburgh and District Water Trust, Lord Provost McDonald presiding. The minutes of the works committee of June 7 contained a report by the engineer stating that the two additional filters at Alnwickhill, equal to one-third of the area of the present six filters, would cost 9,400*l.*, and that a new pure water tank with a capacity of five and a half million gallons would cost 23,600*l.* The same committee also recommended extension of the piping from the new 12-inch Moorfoot pipe in Morningside Road for carrying the Moorfoot water into the district between Morningside and Colinton Road, at a cost of 1,128*l.* or thereby. Bailie Archibald, in moving the approval of the minutes, said that the trustees were now entering upon a new position. They had received the royal assent to their Bill for bringing in an additional supply of water to the town. That would take six or seven years in ordinary course, and in regard to the existing supply it would be their duty to utilise that supply to the very best advantage until they got the new one. For a long time there were numerous complaints of want of water in the High Street in the high tenements, and in order to provide a

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled, either inside or outside with our Trade Mark—The Anchor.

better supply the trustees last year ordered a new main of 24 inches to be laid from Alnwickhill to Hope Park, and a 16-inch main from there to the Tron Church. The result of the laying of these mains had not been fully demonstrated as yet, because the junction had not been made at the Tron Church. But a junction had been made at Hope Park, which already had had a beneficial effect. In the High Street the ordinary pressure at twelve o'clock opposite the Royal Exchange seldom exceeded 30 feet. Now it was up to 60 feet, and the effect of that was that water was flowing into the cisterns on the fifth and sixth flats in the High Street at noon. When once they made the junction at the Tron Church they would be able to give even a better supply. As further proof of the benefits of this supply be mentioned that at the Royal Infirmary the former pressure previously was 40 feet at twelve o'clock, and now it was 80 feet. In regard to the present water supply, there was no need for anxiety and alarm though the season had been dry. They had yesterday 500 million gallons of water less in store than on the corresponding day of last year, but they had 190 millions more than they had on the same day in 1893. As far as they could judge, they would be able to stand a drought for three months without being seriously troubled for water. The proposals of the works committee submitted were in order to utilise to the utmost their available water supply. There was nothing so important as slow filtration for improving a water supply and making it safe for the community, and the system adopted at Alnwickhill was as good as could be found anywhere in the world. The minutes were adopted, and, on the recommendation of the committee, it was agreed to accept the estimate of Messrs. James Young & Sons of 23,394*l.* 2*s.* 10*d.* for the filters and tank.

PARIS TRAMWAYS.

A REPORT on the tramway system of Paris and the Department of the Seine has been prepared by Mr. Graham, third secretary of the British Embassy. It appears that tramways were introduced into France by M. Alphonse Loubat, on his return from a voyage in America, where he had first seen and appreciated this new method of locomotion. To this fact their original name of "Chemins de fer Américains" may be attributed. By virtue of a ministerial decision of August 16, 1853, a preliminary trial took place in Paris on the Quai

Debilly. It proved fairly successful and on February 18, 1854, an imperial decree authorised M. Loubat to establish and work, under certain prescribed regulations, horse-tramways running between Sèvres and Vincennes, with branch lines from the Rond Point de Boulogne. On September 15, 1856, by a second decree, this contract was transferred to the "Compagnie Générale des Omnibus," which had previously entered into a treaty with M. Loubat succeeding to his rights and obligations.

But while in most of the large towns of Europe and America rapid strides were daily made in the development of this new system of transport, its progress in Paris was comparatively slow. The Government refused to permit the circulation of tramways on the Quai des Tuileries, frequented by the Court carriages, or in the crowded and populous streets of the Faubourg St. Antoine, and the only lines actually opened to traffic were those running between the Place de la Concorde, Sèvres and the Rond Point de Boulogne. It was not until 1871 that the first Council General elected, struck by the inadequate means of transport in Paris, planned the construction of a network of tramway lines to connect the different communes of the Department of the Seine. On August 9, 1873, the establishment of this first network was decreed, and the lines composing it have been successively laid down and opened for traffic. Dating from this moment the development of Paris tramways has progressed with extraordinary rapidity. The Loubat concession provided for barely eighteen miles of line, five of which were not even constructed until a period of nearly twenty years had elapsed. In 1893 we find the urban and extra-mural system extending over some 230 miles, and serving to convey annually more than 158,000,000 passengers.

The town of Paris is not entitled to any portion of the receipts of tramway lines, but receives from them:—

1. A ground rent for offices, stations and shelters erected on the highway. 2. A tax of 30 cents (3*d.*) on each car starting from a terminus within Paris. The sum obtained by the town as rent for offices, &c., amounts to 117,500 frs. (4,700*l.*) annually. The State receives nothing from tramway enterprises which are even exempted from the 3 per cent. wheel tax levied on ordinary carriages.

A decree of August 6, 1881, lays down the special conditions tramway enterprises must satisfy in regard to their construction, the circulation of their carriages and their relations with other public services.

The plans of the undertaking must be approved by the Minister of Public Works, Council General or Municipal

NO. 2.—AUTOMATIC SELF-LOCKING ACTION.

NO. 3.—THE SELF-HELP FASTENER.

A large number already in present use giving full satisfaction. Unrivalled.

COMBINED STAYS AND FASTENERS FOR CASEMENTS AND FANLIGHTS.

WE beg to call your special attention to our Patent Combined Stay and Fastener, which, from its great advantages and easy mode of use, can well claim a superiority over the common kinds. You will notice that this Fastener has no complex system of working, is easy to fix, and, whether the casement is open or shut, does not project into the room, but hangs down the centre of the sash free from curtain or blind. The advantage of this Patent Fastener is that, being fixed in the centre of the sash, it affords protection against sudden gusts of wind when open, and keeps the sash safely closed when shut, as it acts as a fastener for the casement as well as a stay. Each of the three kinds of Fasteners affords the same advantages in all respects, as, though varying in shape, size, and price, are only different ideas of the same method. These Casement Fasteners can be used both for wood or iron, for single or double casements. The special pattern is used for fanlights to open outwards, and all can be used both for right or left hand. We can supply these Fasteners in any number of links, according to the extent the casement is required to be opened. We may also note that the Fasteners are well made and finished, can be had both in brass and iron, and are, therefore, well suited for any kind of residence. Quotations and further information will be given on application. Also testimonials. Please state in ordering whether you require them for single or for double casements.

Stay and Fastener shown in Action.

Council, and, once approved, cannot be modified without their sanction. The administration, on the other hand, may call upon the concessionary to make such modifications as may be deemed necessary without thereby giving ground for an indemnity. The concessionary must, at his own expense, restore to their former condition roads on which his works have temporarily interrupted traffic. The number and position of stations, shelters and refuges are decided by the prefect. Expenses incurred in the purchase of land lying outside the roadway, or in damages or indemnities, must be met by the concessionary, but he is at the same time invested with all rights conferred on the administration, such as that of acquiring land by expropriation. Special regulations are applicable to lines running through fortified districts, or over mines or quarries.

The concessionary is answerable for the condition of the roadway over which his tramways pass. When a line is accessible to ordinary traffic (as is usually the case), the part of the necessary expenditure falling upon him is determined by the "cahier des charges." When closed to ordinary traffic he is responsible for the whole. In case of negligence on his part the prefect may proceed to repair the road at his (the concessionary's) expense. The maximum speed of steam tramways must not exceed 20 kiloms. ($12\frac{1}{2}$ miles) an hour. Reserve engines, provided with all necessary implements, must be kept stoked and in readiness to start immediately for the scene of an accident.

If the working of a line is interrupted or so badly managed as to endanger the public safety, the prefect may take measures to insure a provisional service at the concessionary's expense, and if, after three months, the latter cannot prove that he is in a position to resume and continue the working of the said line, it may be adjudicated to a new concessionary, who succeeds to his predecessor's rights and obligations.

The concessionary cannot oppose the construction of roads, railways, canals, &c., which cross his lines, nor can he claim an indemnity on their account. The concession may be withdrawn from him at any moment if, after an inquiry, such a step is considered to be for the public benefit.

The Government, department or commune are entitled to grant concessions of new tramway lines branching off from, or continuing those already conceded, without the original concessionary having any ground to claim an indemnity. The two concessionaries must in such case come to an agreement as regards the use of each other's lines, stations, &c. In cases of

disagreement resort may be had to arbitration; if that fails the decision of the Minister of Public Works is final.

By Art. 21 of the Law of June, 1880, control over and superintendence of the construction and working of tramways is vested in prefects of departments, subject to the supreme authority of the Minister of Public Works. In the Department of the Seine, by a ministerial decree of December 12, 1889, this supervision is exercised by the chief engineer of the department, with the assistance of two engineers of the "Ponts et Chaussées" and one engineer of the mines, acting under the direction of the prefect of the Seine and prefect of police. The chief engineer receives 3,000 frs. (120*l*) a year for his services and his three subordinates 1,500 frs. (40*l*) apiece. A staff of eight inspectors and officials of the "Ponts et Chaussées" are under their orders and exercise direct supervision over the tramway system.

The hours at which tramways run are modified according to different seasons or necessities of the public by the prefect of police, who, after consulting the "Service du Contrôle," gives the necessary directions and communicates any new time-tables to the companies and officials charged with seeing them carried into effect.

Tariffs vary considerably on different lines. They are fixed by the "cahier des charges." According to Art. 33 of the Law of June, 1880, they must be approved by the Minister of Public Works in State concessions and by the prefect in departmental or communal concessions, nor can any alteration in them be made without the prefect's or minister's sanction. They may be revised by the administration every five years. The fares usually charged on tramways within Paris for transport over the whole or part of a line are 30 c. (3*d*) for first-class, and 15 c. (1*½d*) for second-class passengers. First-class passengers secure places in the interior or upon the lower platform of the car, and are entitled to "correspondence," giving them a right to travel without further charge over the whole original line, or change on to any abutting or intersecting line having "correspondence" offices. Second-class passengers ride on the imperial, and must pay first-class fares in order to benefit by "correspondence." Children in arms below four years of age and small parcels not exceeding 10 kilos. in weight, are transported gratuitously. Non-commissioned officers and soldiers in uniform secure all the privileges of first-class passengers on payment of second-class fares.

A clause in concessions usually stipulates that, should the administration require it, the concessionary must organise at

AWARDED GOLD AND SILVER MEDALS.

ANDREW POTTER, Manufacturer, Wolverhampton.

any moment (Sundays and national holidays excepted) special cheap services for the working-classes, in which second-class fares only are charged.

A large proportion of lines are worked by animal power. The use of mechanical power is, however, making rapid strides. The Compagnie Générale des Omnibus employs Rowan's automobiles (worked by steam power) on the Auteuil-Boulogne line, and compressed-air power on the line between Louvre and St. Cloud. The Compagnie des Tramways de Paris et du Département de la Seine makes use of locomotives, on the Lamm and Francq system, for services between Courbevoie and l'Etoile, on the Serpollet system, for those between Neuilly and St. Denis, and of electric power for cars running from the Opéra to St. Denis. Compressed-air power is used on all lines of the Compagnie des Chemins de fer Nantais. The Arpajon and St. Germain companies employ steam-power, that of St. Maur des Fossés compressed-air power. Finally the Belleville Funicular Tramway is worked by an endless cable, setting all its cars in motion and propelled by stationary engines. The various lines are laid in rails of the American, Vignole, Broca, or Marsillon type.

CHICHESTER DRAINAGE.

At the meeting of the Chichester Council on the 14th inst. the following letter from Mr. Peters, the contractor, addressed to the Mayor and members of the Council generally, was read:—

"Gentlemen,—At your Council meeting held on Friday, April 19 last, a letter from me, addressed to Mr. Prior, the chairman of the drainage committee, was read. In this letter I asked that an extension of two months' time should be granted to me. My reasons for making that application were:—1. The exceptional difficulties which I had encountered in prosecuting the works. 2. The exceptional severity of the winter of 1895. The former difficulties consisted of, for instance, enormous volumes of water only 18 inches from the surface of the ground in the Portsmouth Road, at one end of the district, and 3 feet of water in a 6-feet trench at Whyke Lane, at the other end of the district. The latter I am even now endeavouring to check by means of two pulsometer pumps, each throwing 65,000 gallons an hour, and which may be seen at any time by the Council in operation. In this connection I may point out that so long ago as May 4, 1894, I

drew the attention of the Council to the difficulties which the excessive quantity of water in South Pallant had caused me, and two months previous to that (fifteen months ago), foreseeing from past experience what a heavy rainfall in the close of the year would mean, I asked the engineer for an extension of from four to five months, and you may, perhaps, remember that, owing to my representations, the Council seriously considered the advisability of closing the works for the winter months, and extending the contract over two summers. With regard to my second difficulty, namely, the unexampled severity of the frost, a frost the like of which has not been seen in England for at least fifty years, it must be patent to all that no one could have foreseen such a severe frost, and I am not going beyond the mark in saying that the delay caused to me by that frost, during the continuance of which not a stroke of work could be done, was quite equal to the amount of the extension I ask for. I do most earnestly trust, therefore, that the Council, taking into consideration the facts above enumerated, and believing that I have conscientiously endeavoured in every way to properly carry out my contract, will be kind enough to formally grant the extension I have asked for, and so enable me to complete my work to the entire satisfaction of the Council, its engineer and myself—I have the honour to remain, gentlemen, your most obedient and obliged servant, (signed) P. Peters, Horsham. June 12, 1895."

A letter was also read from Mr. Baldwin Latham, the engineer, with reference to the proposal to take part of the work out of the hands of Mr. Peters, in which he said he did not intend to put the order in force, unless he found it was absolutely necessary, but it must be borne in mind that the conditions of the contract had been departed from, and that Mr. Peters had no right to turn any water through the sewers.

Mr. Prior moved the adoption of the report. He said he thought they could hardly accede that evening to Mr. Peters's request. He would be himself only too glad to fall in with his views, but he was told it would probably vitiate the contract, and he thought the better course would be to allow the question of giving an extension of two months to stand over for the present. When the time came he should press upon the committee to the best of his ability the desirability of acceding to Mr. Peters's request. He thought Mr. Peters had had exceptional difficulties to contend with, and if now Mr. Peters did his best to finish the contract he (Mr. Prior) would be glad personally if the Council gave the request favourable consideration. He sincerely hoped Mr. Baldwin Latham would not

No. 596 High Road, Turnham Green, W.

have to take the work out of Mr. Peters's hands, and he regretted the committee had had to take such measures, because he knew that getting these things on the agenda was a very serious matter for Mr. Peters and his sureties. Mr. Peters had called upon him to explain the difficulties he had had to contend with on account of a remark of a member of the Council to the effect that Mr. Peters would not be able to finish the work in two years. This, Mr. Peters said, had been interpreted as referring to his financial position. He very much regretted that such an interpretation should have been made, because he had every reason to believe that Mr. Peters's financial position was quite unassailable.

Mr. Edney said he could see that the subsoil water had been a curse to the contractor, and he could thoroughly sympathise with him. The contractor did not know so much about the underflow as some people, and it seemed to him he had been sold. The town would know about it before the matter was finished, and he believed the paper circulated about 80,000% would come true. As for the contractor allowing water to run through the sewer, he thought he could never without this have got through the work he had done. He contended that everything his party said had come true, and it was worse even than they had prophesied. He was not going to vote at all; the drainage party had got them into a terrible mess, and they must get them out of it.

Mr. Buckell said the fact was that, though there had been a considerable amount of trouble with the subsoil water, the greater part of the work had been accomplished, and Mr. Peters would be able to do the rest perfectly easy. It was simply a matter of the time he would have to do it in. He thought it would be better if the whole question of Mr. Peters's request stood over until the work was finished. He believed the Council would then meet him fairly, while remembering the claims the ratepayers had upon them.

Mr. Prior said that was what he meant to move, and at the suggestion of the Mayor this was added to the motion.

Mr. Fielder said Mr. Peters had undoubtedly had unforeseen difficulties, and he gave very plausible reasons why he should be allowed an additional two months to complete the work in. He thought it a reasonable request, and that the best plan would be to let him know at once he would have the two months he asked for.

The Town Clerk said he thought it would be most unwise on the part of the Council at present to attempt to vary the contract. If they extended the time they would have to enter

into a fresh contract, and the sureties would be released from their responsibility, and have to enter into another bond. Under the circumstances he should certainly advise any private client, and he advised the Council, to leave matters as they were. He did not see how Mr. Peters could be hurt. If he had a sort of quasi-assurance on the part of the Council that the difficulties he had encountered in carrying out the work would be considered, it was as much as Mr. Peters could expect under the circumstances. Looking at all the legal surroundings of the case, he thought it unwise for the Council to vary the contract.

Mr. Fielder said after hearing that statement he would withdraw the resolution he was about to propose.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

11075. Timothy Daly, for "A new plan of window ventilation."

11105. Albert Callister, for "Improvements in apparatus for raising and lowering window sashes and for retaining same in any desired position."

11131. William Thomson and Newton Trevithick Thompson, for "Improvements in water-closets and in valves and supply cisterns therefor, and for other purposes."

11132. Donald Simpson and Alexander Cross, for "An improved hinge for opening and closing window sashes."

11216. Christian Lenz and Johannes Stumpf, for "Improvements in and relating to window frames and sashes or case-ments."

11285. Edward Bauer and Franz Fried, for "Improvements in and relating to water-waste preventers for flushing purposes."

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

THE *Carlisle Journal* says:—A meeting of the Lancashire, Cheshire and Northern Districts Branch of the Incorporated Association of Municipal and County Engineers was held at Keswick, about forty members and friends being present, including Mr. W. Howard Smith, city surveyor, Carlisle, Mr. E. B. Newton, one of his assistants, and Mr. R. Pickering, Whitehaven. By the invitation of Mr. H. Harkewitz, the party paid a visit to the quarries of the Threlkeld Granite Company, Limited, at which over 200 men are now employed, and last year's output reached 80,000 tons. The granite found at Threlkeld is exceedingly hard, and is mostly used for making paving setts, macadam and street flags. During the course of inspection a huge block of granite weighing about 1,000 tons was blasted, and the company also had an opportunity of witnessing the preparation of the setts, flags and cement turned out at these works.

EXTERIOR, JUNIOR CONSTITUTIONAL CLUB, PICCADILLY.

CENTRAL BAY, NORTH SIDE OF CHOIR, ST. SAVIOUR'S CHURCH, SOUTHWARK.

NEW PRESBYTERIAN CHURCH, BROMLEY, KENT.

A NEW church and adjoining buildings were opened on Wednesday last, the 26th inst., for the Presbyterian Church of England, situated in Freeland's Road, Bromley, Kent. The buildings, which occupy a site on the east side of the road, 150 feet by 70 feet, consist of a church, with nave, aisles, and transepts, seated for about 720 worshippers; a hall for Sunday school purposes, to hold about 240, and a conveniently planned arrangement of vestry session, Dorcas and classrooms, and ample lavatory accommodation; a kitchen and heating chamber are provided in the basement. There are small galleries in the nave and transepts, the choir and organ occupying the north gallery. Red brick, with Douling stone dressings, has been used for the external walls and the interior of the church, the seating and gallery fronts are of pitch pine, and the pulpit, communion table, &c., of oak. The design of the buildings is twelfth and thirteenth century Gothic with semicircular arches frequently introduced as in many of the more northerly examples of the period, and there is a spire rising to a height of about 118 feet. The cost of the church and buildings, including organ and fittings, but exclusive of site, will be about 8,000l. The general contract for the work has been admirably carried out by Mr. John Bentley, of Waltham Abbey; Messrs. Charteris & Longley's system of wood-block flooring has been used throughout the church hall and passages on the ground floor; Messrs. B. Ward & Co.'s granolithic concrete has been used for the stairs. The gas work is by Cannon & Sons, of Southwark, and the heating apparatus is by Musgrave & Co., of London and Belfast, and the organ is by Bevington & Sons, of Soho. Mr. John C. T. Murray, of Old Queen Street, Westminster, is the architect, the quantities have been taken out by Messrs. W. H. Barber & Son, of Adelphi, and Mr. Geo. Barber has acted as clerk of the works.

ELECTRICAL.

AT Ayr the Deacons' Court of Sandgate Free Church have unanimously agreed to introduce the electric light into the church. This is said to be the first church in Scotland to avail itself of the new method of lighting.

AT the meeting of the Town Council, Stoke-on-Trent, the question of the extension of the tramways to Trent Vale was considered, and Mr. Wain stated that the company would immediately apply for a provisional order to extend the line to Hanford Bridge as desired, providing the Corporation gave its consent to their proposals. The sub-committee recommended that, subject to the whole of the local authorities in the district being of the same mind, and to satisfactory replies being received to inquiries to be made by the town clerk from places where overhead traction had been adopted, the Corporation should consent to the introduction of electrical traction by means of overhead wires, and subject to the company giving a satisfactory undertaking to apply for a provisional order to extend the present terminus in London Road to Hanford Bridge within a period of two years from the date of the granting of such order.

It has been found necessary to extend the electric light department of the Halifax Corporation. When the new plant was laid down a year ago about 2,000 lamps, each of 16-candle power, had to be supplied. Now the demand has risen to 3,500, and in order to meet the anticipated increase next winter it has been decided to double the present motive power, which is equal to 500-horse. An order has been placed with the Electric Construction Company, Limited, for a 300-unit dynamo, to be coupled direct to a 600 horse-power vertical engine of the Politt & Wigzell make.

VARIETIES.

THE *Dundee Advertiser* says:—The British Aluminium Company has now actually begun the work of "harnessing" (to use the American word) the Falls of Foyers. The company's first step will be the construction of a large tunnel, cut through solid rock, and on this some 500 men will shortly be engaged.

THE Hammersmith New Town Hall, for which Mr. H. Richardson's design was accepted by the Vestry, will be carried out. Mr. Walter Herring has been appointed quantity surveyor. The work is to cost about 25,000*l.*

THE fourth loan exhibition of pictures in the Art Gallery at the Free Library at Walsall was opened on Monday by Mr. Whitworth Wallis, curator of the Birmingham Art Gallery and Museum. Mr. T. A. Hill has lent no fewer than ninety-eight works.

DURING a thunderstorm at Clackmannan the lightning struck the steeple of the established church, and displaced one of the ornamental turrets, which went through the roof and considerably damaged the pew of Lord Balfour of Burleigh, which had been lately renovated.

THE *Scotsman* says:—At a recent meeting of the heritors of the parish of Auchterarder sanction was obtained to the taking down of the two old bells which have done duty in the steeple of the parish church since 1754, in order that these may be replaced by a new bell which the congregation intend to provide by subscription. One of the bells has, indeed, summoned the parishioners to worship for a very much longer period than since 1754, and is said to be 700 years old, having tolled in the Auld or Laigh Kirk, the ruins of which still stand north of the burgh. The bells, along with some other interesting antiquarian relics—a pre-Reformation baptismal font and the framework of an old spiral clock in the steeple—are to be retained by the heritors of Auchterarder.

THE South Staffordshire Mines Drainage Commissioners have passed a resolution confirming a mortgage between the commission and the Public Works Loan Commissioners for securing a loan of 100,000*l.* on the Tipton mines drainage rate, &c.

BUILDING AND BUILDERS.

THE Theological College at Manchester is to be enlarged, at a cost of about 9,000*l.* One of the delegates to the Primitive Methodist Conference at Manchester offered to defray the whole of the expenditure, and this generous offer was accepted with thanks.

THE *Durham County Advertiser* says of the joiners' strike in the Consett District that seven of the master builders have come to terms with their men, who have resumed work. A meeting of the journeyman joiners on strike appointed a deputation, who subsequently interviewed the employers at a meeting held at the Station Hotel, Blackhill. In the course of a protracted discussion, it was elicited that the masters were generally disposed to grant the increase of wages asked for,

but they strongly objected to the adoption of the trades rules for the Consett district. The meeting broke up without any settlement being come to, and some of the journeymen are so sick of the business that they resumed work.

At the meeting of the Norwich Town Council, the scheme for the erection of public baths, which for some time has been under consideration, has been shelved for twelve months.

PLANS of new buildings to be erected in Aberdeen have been sanctioned to the value of 17,000*l*.

TRADE NOTES.

THE new buildings for the County Asylum, Lancaster, which are being erected at a cost of about 20,000*l*., from the plans and under the superintendence of Mr. E. Howard Dawson, architect, of Lancaster, are now nearing completion. The inlet ventilating appliances have been supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE "Climax" Relief Valve Company inform us that in consequence of the rapid increase of their business, they have removed to larger premises at 209 City Road, E.C.

A STAINED-GLASS memorial window, consisting of three lights, is to be inserted in the church at Pipe Hays, Lichfield, from the design of Messrs. Swain Bourne & Son, artists in stained-glass, Birmingham and London. The subjects are those of "The Good Shepherd" in the centre light, whilst on either side respectively are figures illustrative of Divine truth, the details of which are of an elaborate treatment.

At a meeting of the Glasgow Town Council as improvement trustees it was agreed to invite tenders for the erection of houses in the Anderston district and in the Townhead district for the purpose of meeting the requirements of the working classes.

At the meeting of the Stoke-on-Trent Town Council a sub-committee was appointed to visit various towns for the purpose of more minutely investigating the various systems of sewage disposal. On the recommendation of the finance committee it was resolved that application be made to the Local Government Board for sanction to borrow 2,247*l*. 7*s*.—for improvement of the Trent Bridge, 486*l*. 7*s*.; Lytton Street sewer, 150*l*.; palisading the canal in London Road, 90*l*.; and constructing new road to Basford, 1,520*l*.

PAINTING WITHOUT BRUSHES.

ON Monday last the Barry Dock, Cardiff, was the scene of some important and interesting experiments with a machine which is likely, if not to revolutionise, at least to very extensively modify the methods of the painting trade. The machine in question is the property of the Pneumatic Brushless Painting Machine Syndicate, whose address is Trafalgar Buildings, Northumberland Avenue, and is simple in construction, effective and exceedingly rapid in action, and comparatively inexpensive to purchase. It applies the paint or other liquid to the surface to be coated in an atomised condition by the action of an air-blast, the paint being for this purpose contained in a closed vessel into which air is pumped whereby the paint is forced through a tube at a rate dependent on the pressure of the air supplied to the vessel. At the orifice of this tube the stream of paint is met by a blast of air issuing from a nozzle, the blast being supplied through a flexible tube whereby the stream of paint is pulverised and projected in the form of exceedingly fine spray, the blast being produced by a hand-operated air-pump or compressor provided with a reservoir in order to render the blast continuous. By this means a uniformly smooth surface is quickly obtained without any of the care necessary to avoid the marks left by a brush when one is used in the ordinary way.

Among the demonstrations of its utility which were given on Monday were the painting of doors, panels, carved and moulded woodwork, Lincrusta surfaces, &c., all of which were coated in an incredibly short space of time and with an accuracy and fine finish which left nothing to desire. A competition in which a railway wagon was painted by the machine in 16½ minutes, as against another painted by two men in 19½ minutes, and the painting of a ship's side at the astonishingly rapid rate of 80 square feet in 6½ minutes. Even this rapidity, by the way, can be almost indefinitely augmented by the multiplication of the above-mentioned nozzle; but each additional one would, of course, require an increased pneumatic pressure. The machine in its simple form will, however, be found amply sufficient for all ordinary purposes, and will prove invaluable in the painting of large surfaces such as railway-station roofs, bridges, &c., as well as for all kinds of internal and external decorative work of extended superficial area. In its present form it will hardly supersede the brush in detail work, such as the picking out of beadings and mouldings, but will prove a valuable auxiliary to it in the treatment of carved

JOHN SELL COTMAN'S ARCHITECTURAL ANTIQUITIES OF NORMANDY.

It is agreed by all who are competent to judge that JOHN SELL COTMAN was one of the greatest of English artists.

COTMAN'S "Architectural Antiquities of Normandy" is invaluable to architects, but as it was necessarily published at an almost prohibitive price, it can only be found in a few great libraries. Encouraged by the success which attended the publication of the water-colour drawings of COTMAN, the publisher has decided to reproduce the entire work in "The Architect," with the letter-press descriptions by Dawson Turner. The publication of the series will commence on Friday, July 5, 1895. The usual ink-photo illustrations will also appear in each number.

Price 4*d*. weekly, or sent direct by post on receipt of cheque or postal order for 19*s*. per annum. Immediate application should be made, as these numbers are likely to soon run out of print.

P. A. GILBERT WOOD,

PUBLISHER, 175 STRAND, LONDON, W.C.

or cast work, as the spray readily penetrates into interstices which the brush would not enter; for this reason also its utility in painting girders, boilers, and other constructive ironwork will be at once apparent. The machine is, as mentioned above, simple in construction, and hence cannot readily get out of order, and in the event of its becoming clogged, which does not frequently happen, a mild dose of turpentine will at once put matters right again. It is economical from the fact that it deposits more evenly and produces a finer surface, so that fewer coats are required to produce a given finish, and for the same reason less fining down is needed, as after the first coat has been sandpapered, no further preparation is required. Far less scaffolding is necessary, as an extension is fitted to the machine giving a range of 6 feet from one standpoint, instead of working at the utmost at arm's length, and of course all the cost of wear and tear, loss and misappropriation of brushes is obviated.

THE HOUSE BEAUTIFUL.

MR. PUNCH'S time-honoured advice "to those about to marry," which advice, by the way, has not been too generally taken *au sérieux*, should now be negative to date, to advocate a visit to Messrs. Graham & Banks, 445 Oxford Street, where this enterprising firm, both members of which may be said to have a life-long intimacy with decorative art, have fitted up a model house, the various apartments of which, in sufficient harmony one with another, each illustrates in itself a distinct style or period, while the whole is designed as an object-lesson as to how a house can be artistically decorated and furnished at a cost varying from 500*l.* to 5,000*l.*; and it is well to observe (indeed, the fact is too obvious to be overlooked) that beauty, although everywhere conspicuous, in no wise takes precedence of comfort, which instead accompanies it step by step.

The entrance-hall is a sumptuously and picturesquely appointed apartment of the period of Francis I., of artistic memory. A conspicuous feature of this room is to be the chimney-corner. This was not finished on the occasion of our visit, but without it the rich panelling of the walls and ceiling, the elegant hangings and choice furniture are sufficiently satisfying to reconcile one to the absence of additional attractions. The dining-room is an essentially restful and cosy room in

Carolean or Jacobean style, with its quiet but substantial oaken furniture and painted tapestry frieze representing a hunting scene. In this room also the fireplace is treated, as it should be, as an important feature, as is the roomy recessed window with its gracefully draped curtains. The drawing-room, with its white walls panelled in soft delicate rose, is in Louis XVI. style, and the harmonious blending of shades of pale rose and green in the carpet, furniture and hangings is wonderfully light and elegant. The decoration of the staircase is rich and warm in tone and distinctly oriental in character, an effect to which the Moorish arches fixed to the doors materially contribute. The principal bedroom, which is enamelled in very pale pink and cream, is arranged entirely on the "fitment" principle, which, although it reduces the apparent size of the apartment, provides an immense amount of wardrobe and cupboard accommodation, and at the same time does away with all excrescent furniture and gives a wonderfully snug and compact appearance to the room without in the least suggesting stuffiness. Another room is 'contrived a double debt to pay'—bedroom by night and sitting-room by day. A chimney-corner really built out into the room, but apparently recessed from it, gives space for an ingeniously concealed cupboard on either side, in one of which stands the washstand and appurtenances, while the other makes a capital wardrobe; the artistically draped bedstead stands in another nook, and can be concealed from view by a curtain, and a dainty little boudoir alone remains. The model house is lighted throughout by electricity—in some cases very ingeniously, as, for instance, in the hall, where, shining through a casement, it produces quite the effect of daylight where real daylight could not be obtained.

THOMAS WALKER & CO.

BOUND up in a convenient form we have received from Messrs. Thomas Walker & Co., of the Saw Mills, West Hartlepool, a series of thirty plates with views of their saw mills, works, &c. Messrs. Walker & Co. have on hand foreign and English timber of every description; deals, battens and boards; large stocks of seasoned boards; wainscot oak, Baltic oak, yellow pine, pitch pine, &c.; wainscot and Baltic oak flooring, pitch pine flooring; oak waggon scantling, ships' decks, &c.; mouldings, plaster and slaters' laths, spouts, &c.; wood-block flooring in oak, redwood, pitch pine, and high-class joinery of every kind. Church fittings are a specialty, and all their manufactured work

is made from thoroughly seasoned timber. Estimates are given from architects' drawings.

In regard of the illustrations, which are intended to indicate the extent and character of their business, those views which illustrate the interiors of various churches and show the beautiful wood fittings and carved woodwork executed by them are excellently adapted as a guide by which to judge of the excellent work hitherto carried out by the company. Taking the plates in order, we are first introduced to the main building, not an unsightly one, but a handsome building, two sides of which give an idea of the character of the structure. Next, the railway entrance to the saw mill shows the convenience for delivery and despatch. There follow views, one of the wood-block flooring department and other views, including those in the saw mill, also drying kiln (six in use), the seasoned stock-yard, drying sheds (650 feet long by 30 feet wide), interior views of the joiners' shops, the wood-block flooring department, drying-shed on dock side, timber stocked on dock side, timber rafts in ponds, vessels discharging timber, &c. Some views represent the offices, private office rooms as well as the general office, and there we begin to see in the fittings some of the able adaptation of wood of various kinds. The work executed for churches is well shown. The examples shown are too numerous to deal with. Many, no doubt, are acquainted with them, viz. the beautiful carved oak roofing and fans at Stonyhurst College, the seating at St. Joseph's Church, West Hartlepool, the seating at St. Michael's, Newcastle-on-Tyne, with nave roofs, these works having been executed for Messrs. Dunn, Hansom & Dunn, architects, Newcastle-on-Tyne. Also excellent chancel fittings for St. Cuthbert's, Chester-le-Street, staircases, ceilings, panelling, mantel-pieces, &c., for private mansions, &c. In addition the provision of bar-fittings is no small branch of work, and there is also illustrated a fine example of a conservatory, made for Aldin Grange, Durham. Many will be interested in seeing the pleasing designs they have worked out in their inch solid oak parquet flooring.

RUTHERGLEN BRIDGE, GLASGOW.

ON June 19, the memorial stone of the new bridge across the Clyde was laid by Mr. John Macfarlane, convener of the joint-bridge committee. The bridge it will supersede, and which James Watt is supposed to have designed, was closed in 1890. The delays in erecting a new bridge arose, says the *Glasgow*

Herald, from the number of local authorities directly concerned, which at the outset numbered no less than five, viz. :—Glasgow, Rutherglen, the two road committees of the counties of the lower and middle wards of Lanark, and the county of Renfrew, all of whom had to agree before building operations could commence. Having in view the increasing requirements of the city and its surroundings, the representatives of Glasgow and Rutherglen desired that the new bridge should be of a width, durability as regards material, and in other respects worthy of the two municipalities, while the county representatives were content with a bridge of less width, and to be of steel or iron instead of granite. Ultimately a friendly arrangement was come to, that the bridge should be built in accordance with the view of Glasgow and Rutherglen, the county share of the cost being limited to a definite sum, based on their idea of the requirements. Owing to the increased width of the bridge, it became necessary that additional ground for its site and approaches should be acquired, and the negotiations for this and for restricting the working of minerals in proximity, all which have been arranged for, consumed a further considerable time. In the interim a substantial service bridge to carry the traffic and enable the old bridge to be removed, and admit of the new one being erected on its site, was constructed by Messrs. Hugh Kennedy & Sons, builders, Partick, and opened to the public on April 22, 1890, at a structural cost of 3,171*l.* 15*s.* The old bridge was on the same day closed against all traffic, and subsequently removed as part of the contract for the new bridge. Plans of the new or permanent bridge were submitted by Messrs. Crouch & Hogg, the engineers, on January 2, 1891, and the consent of H.M. Board of Trade, with a conveyance by that Department of the foreshore and bed of the river, which is here tidal, having been obtained, alternative specifications were prepared and tenders by contractors advertised for. Seven contractors of standing sent in offers, and that of Messrs. Morrison & Mason, Limited, was on January 27, 1892, provisionally accepted, pending the final agreement between the burghs and the county as to the width and material of which the bridge was to be constructed. This was finally arranged, and a minute of agreement signed and sealed of dates February 13 and 27 and May 11, 1893, approving of the plans, and settling the quotas of expense to be borne by each authority. Acting upon this agreement, the special building committee appointed to carry out the work lost no time in arranging with the contractors, and operations were commenced by them on February 23, 1893. Owing to softer material than the pre-

OPTIMUS SUPERIOR PHOTOGRAPHIC OUTFITS.

EXTRA LONG FOCUS CAMERA.

British Journal of Photography says:—"The present model Rayment Camera is among the very lightest of actually rigid cameras offered to the public. The rapidity of opening and closing is greatly facilitated by the additional arrangement for throwing the pinion out of gear from the rack. There is no curtailment of view when lenses of short focus and wide angular aperture are in use. All movements necessary to the modern scientific photographer are included in this compact instrument."

Including Rayment Camera, Three Double Dark Slides, "Optimus" Rapid Rectilinear Lens, Instantaneous Shutter, Tripod Stand, Waterproof Case, complete—

1a CRESCENT, MINORIES, LONDON, E.C.

liminary bores had given reason to suspect appearing in the excavations for the abutments on both sides of the river, some delay and expense in piling to secure the requisite support occurred in the end of 1893 and early part of 1894, since when, however, steady progress has been made, and with a most gratifying immunity from accident to life or limb, but, owing to difficulty experienced in obtaining supplies of granite, it will be another year before the bridge is completely finished and opened to the public. The architectural features of the bridge are thus described by the engineers:—The new bridge consists of three segmental arches, the centre one having a span of 100 feet and a rise of 12 feet 6 inches, and those on either side of it a span of 90 feet and a rise of 11 feet 7 inches. The clear width between parapets is 60 feet—a roadway of 36 feet wide and two foot pavements of 12 feet each. There is ample room for two lines of tramway, as well as for the ordinary traffic, and the gradient of the approaches is 1 in 60. The arches are of granite, and the abutments, spandrels and piers are faced with granite, which is being supplied from Aberdeen, Dalbeattie and Cornwall. The courses are chamfered, and the piers are formed with starlings or cutwaters at either end, surmounted by massive caps, from which pilasters are carried up between the arches, and there are larger pilasters at the abutments. A bold cornice, with classic mouldings, runs along the whole length of the bridge, and is carried through the abutment and pier pilasters, and the parapet, which is solid, rises above this. Being built of granite, no ornamental work in the shape of carving has been attempted, but the endeavour has been to obtain a satisfactory architectural effect by a well-proportioned and graceful outline. Respecting the mode of conducting the work, the engineers report that at the abutments the ground was excavated and bearing piles driven to an average depth of 43 feet, so as to secure a reliable foundation.

The most difficult portion of the work—that of founding the piers—was accomplished by the pneumatic process. The piers consist of a lower portion, or caisson, built of steel plates, and forming what is known as the working chamber, in which all the excavation is carried on, and which communicates with the surface by means of circular shafts, 3 feet in diameter, up which the excavated material is hoisted, and by which the men enter and leave the working chamber. The caisson, with the exception of the working chamber, is filled with concrete, and above it there is a height of solid brickwork reaching to the bed of the river, and on this brickwork the pier

proper, consisting of freestone ashlar, faced with granite, is built. The caisson is first of all erected on staging, then lowered to the river bed and the air-locks, through which the men and excavated materials pass, fixed into position on the top of the shafts. The caisson is then filled with concrete, and brickwork added till the top is well above high-water level. Air, at a pressure sufficient to exclude the water, is then forced into the working chamber, and men descending to it by the shafts, the work of excavation is commenced. As it proceeds the pier slowly sinks, more brickwork being added so as to keep its top always above high water. When the proper height of brickwork has been built the granite and freestone masonry is commenced, and added to in the same manner as the brickwork, till at length the cutting edge of the caisson reaches the rock at about 57 feet below high water. The working chamber and shafts are then filled with concrete, and the building of the pier completed. The great novelty of this portion of the work lies in the fact that the pier proper is actually being built while its substructure is in constant motion, and, consequently, careful watching is required, so that when the caisson finally reaches the rock the upper portion shall be in its correct position. At the present time the abutments and piers are complete as far as it is possible to go till the arches are turned, and preparations are now so well forward that this work is expected to be finished in the autumn, and the bridge itself open for traffic early next year. The total estimated cost for ground and approaches, construction of the new and removal of the old bridge, including engineering, &c., fees, inspector's wages and miscellaneous, was 70,000*l.*, of which the county of Lanark contributed a slump sum of 12,000*l.*, the burgh of Rutherglen in the proportion of 1*s.* 5½*d.* per 1*l.*, equal to 5,104*l.* 3*s.* 4*d.*, and the city of Glasgow the balance of 52,895*l.* 16*s.* 8*d.*, or 15*s.* 1½*d.* per 1*l.*

LANCASHIRE BUILDERS.

THE first general meeting of the Lancashire Building Trade Employers was held at Accrington on the 18th inst. Mr. John Fecitt, Blackburn, presided, and in opening the meeting spoke of the necessity that existed for employers to organise not only to combat more effectually combinations of the workmen when they tried to impose unfair restrictions on trade, but to obtain from architects and the public generally juster and more generous treatment. Though the building trade was one of, if not the most important of, the industries of the country,

he thought the fact was not recognised as it ought to be. The report of the provisional committee was then presented. After detailing what had been done to strengthen the Federation since it was established in December last, the committee stated that the scheme had been very favourably received throughout the county. Several other towns were expected to become affiliated shortly, and in districts where no local associations at present exist, the expediency of forming branches was under consideration. Returns of the relations between employers and employed in the federated towns were also presented. The report was adopted. Mr. Fecitt was elected president for the ensuing year, and Mr. Councillor Cunliffe, Bolton, was elected vice-president; Mr. F. W. Briscoe, Bolton, treasurer; and Messrs. W. Shepherd, Rochdale, and J. Hawley, Colne, auditors; together with an executive committee. Mr. John Tomlinson, of Preston, secretary of the Master Builders' Association in that town, was elected secretary. The draft rules were then considered, and a few alterations having been made, were adopted and ordered to be printed. On the motion of the Bolton representative, it was decided to try and affiliate the Federation to the National Association of Master Builders of Great Britain. The Darwen representatives reported the settlement of the masons' strike in their town, and after hearing the Chorley delegates, it was agreed to support the local employers in their dispute with the operative joiners. A long discussion ensued on the best method of strengthening the Federation, and a sub-committee was appointed to visit the non-associated towns and explain the objects of the Federation. It was decided to adopt a form of conditions of contract, &c., to be approved by the committee for use in the federated towns not at present having one, and after a considerable debate a resolution on the subject of prime cost sums in building quantities was referred to a future meeting. A vote of thanks was passed to the chairman for presiding.

HOUSES FOR WORKING CLASSES IN GLASGOW.

A REPORT has been prepared by the city engineer of Glasgow showing the probable financial income of the new buildings proposed to be erected in the Anderston district. The report stated that the engineer had, along with the manager, considered the rentals which might be derived from the properties which it is proposed to erect in Warroch Street, Stobcross Street, and Cheapside Street, and find that, rating shop floorage

at values of 1s., 1s. 3d., 1s. 6d. per square foot, and charging twenty-one houses of two apartments at 9l. 15s., and six houses of two apartments at 9l. 18s., there will be a gross rental of 453l. 8s. 9d. derived from the whole subjects. The buildings are estimated to cost 4,335l., and the area of ground occupied is 790 square yards. Making the customary abatement of 25 per cent. from the gross rental, and charging interest upon the cost of the buildings at 3½ per cent., there remains a free surplus of 188l. 9s. 3d., which, capitalised, is equivalent to 4l. 12s. 6d. per square yard for the site. He also considered the rentals which might be derived from the properties which it is proposed to erect in Cheapside Street, Stobcross Street and Piccadilly Street, and found that, rating shop floorage at values of 1s., 1s. 3d., 1s. 6d. per square foot, and charging three houses of three apartments at 12l. 10s., twelve houses of two apartments at 9l. 15s., eleven houses of two apartments at 9l. 10s., and sixteen houses of one apartment at 5l., there will be a gross rental of 517l. 7s. 6d. derived from the whole subjects. The buildings are estimated to cost 5,571l. 12s. 6d., and the area of ground occupied is 900 square yards. Making the customary abatement of 25 per cent. from the gross rental, and charging interest upon the cost of the buildings at 3½ per cent., there remains a free surplus of 193l. 3s. 6d., which capitalised is equivalent to 4l. 6s. per square yard. The sub-committee approved the report, and resolved to recommend as follows:—

1. That the city engineer be authorised to prepare the necessary working drawings and specification for the erection of the buildings; 2, that Messrs. Duncanson & Henderson be appointed as measurers for the same; and 3, that the secretary be authorised to advertise for tenders for the several works connected with the buildings. The minutes also contained a report by the city engineer as to the erection of artisan dwellings in Macleod Street, Townhead. The report stated that the plans provided fourteen houses of two rooms and one house of three apartments. These, rated at 9l. 18s. and 14l. 10s. respectively, gave a gross rental of 153l. 10s. The estimated cost of the buildings was 2,252l., and the area of the site was 456 square yards. Making the usual abatement of 25 per cent. on the rental, and charging interest at 3½ per cent. on the outlay, there was left a surplus of 36l., which was equivalent to an overhead price of 1l. 11s. 6d. per square yard for the site. Similar recommendations were offered about plans, quantities and tenders. The Glasgow Improvement Trust have approved of the schemes.

CAMBRIDGE SEWERAGE WORKS.

MEMBERS of the Liverpool Engineering Society on Saturday paid a visit to Cambridge. Before inspecting the works of the new sewerage scheme, they were conducted over some of the University colleges by the engineer-in-chief of the sewerage works, Mr. J. T. Wood, accompanied by the president of the Society, Professor H. S. Hele-Shaw. Among the places of interest visited were the chapel of King's College, the halls and combination rooms of St. John's and Trinity. At Trinity the members inspected the remarkable kitchen and cellars. After a hurried glance at some of the more interesting features of the different colleges, they set out for an inspection of the sewerage works in progress. The plans relating to the scheme were exhibited and explained by Mr. Wood. The existing sewers by which the town is drained discharge directly into the river Cam, on which the town and colleges abut. These sewers have for the greater part been constructed in brickwork, and at a time when the importance of good workmanship and proper alignment were not considered so essential as in these days of sanitary reform; consequently many of the existing drains have become reservoirs of deposit, and but inadequately perform the objects for which they were intended. The Corporation, acting on the advice of their engineer, determined to have an entirely new system of sewers laid down and the old ones removed, or cleaned out and blocked up. The works now in progress comprise the construction of $1\frac{3}{4}$ mile of brickwork sewers, about 32 miles of pipe sewers, and 23 miles of surface-water drains. The drains for the surface water will discharge directly into the river. The sewage will be collected and discharged into a well at the pumping station, situate on the banks of the river Cam, at the north end of the town. It will be pumped from there, and forced through the 24-inch cast-iron rising main into the settling tanks at the sewage farm, over two miles away from the town. After chemical treatment in the tanks, the liquid portion of the sewage will be spread over some 70 acres of land (which is being specially underdrained), and will ultimately be discharged in an unoffensive state into the river Cam, some four miles below the town. The solid matter deposited in the tanks will be collected and compressed by mechanical means, and finally sold or used as manure. The works at the pumping station and destructor are practically complete. The engines and pumps have been constructed by Messrs. Hathorn, Davey & Co., of Leeds. They are two compound differential

expansive engines of seventy horse-power each, capable of delivering about 270,000 gallons per hour. The destructor for the disposal of house and trade refuse has six cells, with a chimney about 175 feet high. Between each pair of cells is placed a Babcock and Wilcox boiler in which steam and eighty pounds pressure for driving the pumping engines will be generated. These destructors contain many novel points introduced by Mr. J. A. Brodie, Mr. Wood's partner, and it is believed they will prove very efficient, as they have been carefully designed to generate the maximum amount of heat with the minimum amount of nuisance.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 11328. Archibald Griffin Rider, for "Improvements in sliding-sash windows."
- 11344. Hugh Thomson, for "Improvements in apparatus for flushing water-closets."
- 11410. Herbert Clarke, for "A window or door fastener."
- 11470. Friedrich Kessler, for "A springless automatic door-closing device."
- 11495. Charles Field, for "Improvements in ventilators and chimney-tops."
- 11588. Harry Dews, for "Improvements in bolts for locks, latches and the like."
- 11687. Samuel Willoughby, for "A new or improved machine for removing the deposit from sewer-gulleys or the like."
